# **Common Mode Filter with ESD Protection**

#### **Functional Description**

The EMI2180 is an industry first Common Mode Filter tuned to MHL speed (CMF) with integrated ESD protection. Differential signaling I/Os can now have both common mode filtering and ESD protection in one package, instead of using separate devices for each function. In addition, traditional common mode chokes are coil-based, while the EMI2180 is silicon-based. This enables the EMI2180 to have a smaller footprint and profile. The EMI2180 protects against ESD pulses up to  $\pm 15$  kV contact per the IEC61000–4–2 standard.

The EMI2180 is particularly well-suited for protecting systems using high-speed differential ports such as MHL, MHL to USB interface corresponding ports in removable storage, digital camcorders, DVD-RW drives; and other applications where ESD protection are required in a small footprint package.

The EMI2180 is available in a RoHS-compliant, WDFN-8 package.

#### Features

- Single Integrated Package for Common Mode Filter (CMF) and ESD Protection for MHL High Speed Data Lines
- High Differential Mode Bandwidth Cutoff Frequency for Best Signal Integrity
- Low Profile with Small Footprint in WDFN6 1.6 x 2.0 mm Package
- Provides ESD Protection to IEC61000–4–2 Level 4, ±15 kV Contact Discharge
- Low Channel Input Capacitance
- These Devices are Pb-Free and are RoHS Compliant

# Applications

- I/O Ports, Display, MHL in Mobile Phones, Wireless Handsets and Cameras
- MHL to USB Interface
- High-Speed Differential Data Lines

#### ELECTRICAL CHARACTERISTICS (T<sub>A</sub> = 25°C unless otherwise noted)

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.
Standard IEC61000-4-2 with C<sub>Discharge</sub> = 150 pF, R<sub>Discharge</sub> = 330, V<sub>N</sub> grounded.
These measurements performed with no external capacitor.

3. TVS devices are normally selected according to the working peak reverse voltage (V<sub>RWM</sub>), which should be equal or greater than the DC or continuous peak operating voltage level

4. V<sub>BR</sub> is measured at pulse test current I<sub>T</sub>.

#### TRANSMISSION LINE PULSE (TLP) MEASUREMENTS

Transmission Line Pulse (TLP) provides current versus voltage (I–V) curves in which each data point is obtained from a 100 ns long rectangular pulse from a charged transmission line. A simplified schematic of a typical TLP system is shown in Figure 4. TLP I–V curves of ESD protection devices accurately demonstrate the product's ESD capability because the 10 s of amps current levels and under 100 ns time scale match those of an ESD event. This is illustrated in Figure 5 where an 8 kV IEC61000–4–2 current waveform is compared with TLP current pulses at 8 and 16 A. A TLP curve shows the voltage at which the device turns on as well as how well the device clamps voltage over a range of current levels. Typical TLP I–V curves for the EMI2180 are shown in Figure 6.

# ESD VOLTAGE CLAMPING

For sensitive circuit elements it is important to limit the voltage that an IC will be exposed to during an ESD event to as low a voltage as possible. The ESD clamping voltage is the voltage drop across the ESD protection diode during an ESD event per the IEC61000–4–2 waveform. Since the IEC61000–4–2 was written as a pass/fail spec for larger systems such as cell phones or laptop computers it is not clearly defined in the spec how to specify a clamping voltage at the device level. ON Semiconductor has developed a way to examine the entire voltage waveform across the ESD protection diode over the time domain of an ESD pulse in the form of an oscilloscope screenshot, which can be found on the datasheets for all ESD protection diodes. For more information on how ON Semiconductor creates these screenshots and how to interpret them please refer to On Semiconductor Application Notes AND8307/D and AND8308/D.
