

# NCV7381

## FlexRay® Transceiver, Clamp 30

NCV7381 is a single-channel FlexRay bus driver compliant with the FlexRay Electrical Physical Layer Specification Rev. 3.0.1, capable of communicating at speeds of up to 10 Mbit/s. It provides differential transmit and receive capability between a wired FlexRay communication medium on one side and a protocol controller and a host on the other side.

NCV7381 mode control functionality is optimized for nodes permanently connected to car battery.

It offers excellent EMC and ESD performance.

### KEY FEATURES

#### General

- Compliant with FlexRay Electrical Physical Layer Specification Rev 3.0.1
- FlexRay Transmitter and Receiver in Normal-power Modes for Communication up to 10 Mbit/s
- Support of 60 ns Bit Time
- FlexRay Low-power Mode Receiver for Remote Wakeup Detection
- Excellent Electromagnetic Susceptibility (EMS) Level over Full Frequency Range. Very Low Electromagnetic Emissions (EME)
- Bus Pins Protected against >10 kV System ESD Pulses
- Safe Behavior under Missing Supply or No Supply Conditions
- Interface Pins for a Protocol Controller and a Host (TxD, RxD, TxEN, RxEN, STBN, BGE, EN, ERRN)
- INH Output for Control of External Regulators
- Local Wakeup Pin WAKE
- TxEN Time-out
- BGE Feedback
- Supply Pins  $V_{BAT}$ ,  $V_{CC}$ ,  $V_{IO}$  with Independent Voltage Ramp Up:
  - ♦  $V_{BAT}$  Supply Parametrical Range from 5.5 V to 50 V
  - ♦  $V_{CC}$  Supply Parametrical Range from 4.75 V to 5.25 V
  - ♦  $V_{IO}$  Supply Parametrical Range from 2.3 V to 5.25 V
- Compatible with 14 V and 28 V Systems
- Operating Ambient Temperature  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  ( $T_{AMB\_Class1}$ )
- Junction Temperature Monitoring with Two Levels
- SSOP-16 Package
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

## FUNCTIONAL DESCRIPTION

## Operating Modes

NCV7381 can switch between several operating modes depicted in Figure 3. In Normal and Receive-only modes, the chip interconnects a FlexRay communication controller with the bus medium for full-speed communication. These two modes are also referred to as normal-power modes.

In Standby and Sleep modes, the communication is suspended and the power consumption is substantially reduced. A wakeup on the bus or through a locally monitored signal on pin WAKE can be detected and signaled to the host. Go-to-sleep mode is a temporary mode ensuring

correct transition between any mode and the Sleep mode. All three modes – Standby, Sleep and Go-to-sleep – are referred to as low-power modes.

The operating mode selected is a function of the host signals STBN and EN, the state of the supply voltages and the wakeup detection. As long as all three supplies ( $V_{BAT}$ ,  $V_{CC}$ ,  $V_{IO}$ ) remain above their respective under-voltage detection levels, the logical control by EN and STBN pins shown in Figure 3 applies. Influence of the power-supplies and of the wakeup detection on the operating modes is described in subsequent paragraphs.

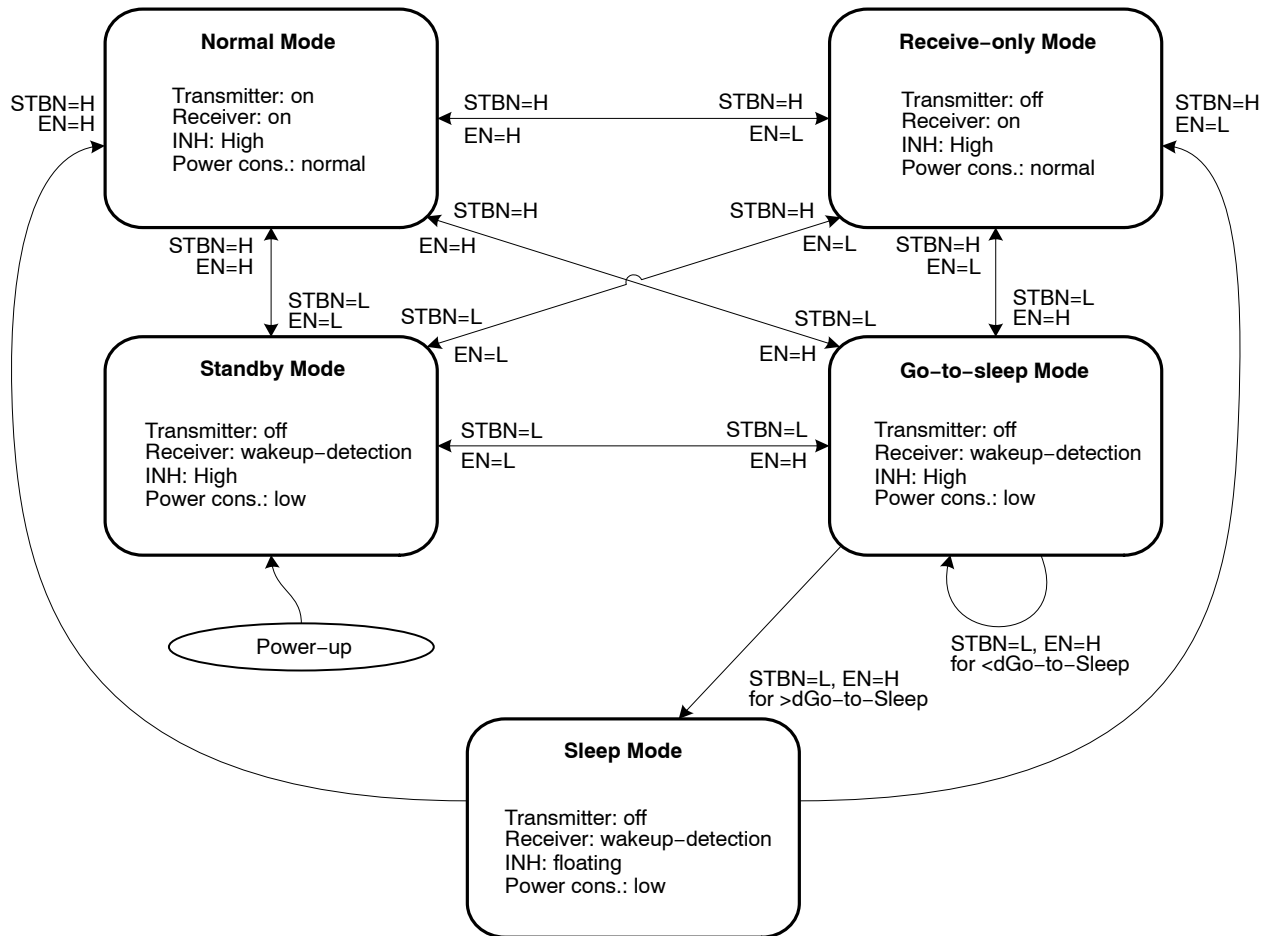

Figure 3. Operating Modes and their Control by the STBN and EN Pins

Figure 4. Timing Diagram of Operating Modes Control by the STBN and EN Pins

#### Power Supplies and Power Supply Monitoring

NCV7381 is supplied by three pins.  $V_{BAT}$  is the main supply both for NCV7381 and the full electronic module.  $V_{BAT}$  will be typically connected to the automobile battery through a reverse-polarity protection.  $V_{CC}$  is a 5 V low-voltage supply primarily powering the FlexRay bus driver core in a normal-power mode.  $V_{IO}$  supply serves to adapt the logical levels of NCV7381 to the host and/or the FlexRay communication controller digital signal levels. All supplies should be properly decoupled by filtering capacitors – see Figure 2 and Table 2.

All three supplies are monitored by under-voltage detectors with individual thresholds and filtering times both for under-voltage detection and recovery – see Table 18.

#### Logic Level Adaptation

Level shift input  $V_{IO}$  is used to apply a reference voltage  $uV_{DIG} = uV_{IO}$  to all digital inputs and outputs in order to adapt the logical levels of NCV7381 to the host and/or the FlexRay communication controller digital signal levels

## Internal Flags

The NCV7381 control logic uses a number of internal flags (i.e. one-bit memories) reflecting important conditions or events. Table 3 summarizes the individual flags and the conditions that lead to a set or reset of the flags.

**Table 3. INTERNAL FLAGS**

Flag	Set Condition	Reset Condition	Comment
Local Wakeup	Low level detected on WAKE pin in a low-power mode	Low-power mode is entered	
Remote Wakeup	Remote wakeup detected on the bus in a low-power mode	Low-power mode is entered	
Wakeup	Local Wakeup flag changes to set or Remote Wakeup flag changes to set	Normal mode is entered or Low-power mode is entered or Any under-voltage flag becomes set	
Power-on	Internal power supply of the chip becomes sufficient for the operation of the control logic	Normal mode is entered	
Thermal Warning	Junction temperature is higher than $T_{jw}$ (typ. 140°C) in a normal-power mode and $V_{BAT}$ is not in under-voltage	(Junction temperature is below $T_{jw}$ in a normal-power mode or the status register is read in a low-power mode) and $V_{BAT}$ is not in under-voltage	The thermal warning flag has no influence on the bus driver function
Thermal Shutdown	Junction temperature is higher than $T_{jwd}$ (typ. 165°C) in a normal-power mode and $V_{BAT}$ is not in under-voltage	Junction temperature is below $T_{jwd}$ in a normal-power mode and falling edge on TxEN and $V_{BAT}$ is not in under-voltage	The transmitter is disabled as long as the thermal shutdown flag is set
TxEN Timeout	TxEN is Low for longer than $dB_{TxActiveMax}$ (typ. 1.5 ms) and bus driver is in Normal mode	TxEN is High or Normal mode is left	The transmitter is disabled as long as the timeout flag is set
Bus Error	Transmitter is enabled and Data on bus are different from TxD signal (sampled after each TXD edge)	(Transmitter is enabled and Data on bus are identical to TxD signal) or Transmitter is disabled	The bus error flag has no influence on the bus driver function
$V_{BAT}$ Under-voltage	$V_{BAT}$ is below the under-voltage threshold for longer than $dB_{DUV_{BAT}}$	$V_{BAT}$ is above the under-voltage threshold for longer than $dB_{DRV_{BAT}}$ or Wake flag becomes set	
$V_{CC}$ Under-voltage	$V_{CC}$ is below the under-voltage threshold for longer than $dB_{DUV_{CC}}$	$V_{CC}$ is above the under-voltage threshold for longer than $dB_{DRV_{CC}}$ or Wake flag becomes set	
$V_{IO}$ Under-voltage	$V_{IO}$ is below the under-voltage threshold for longer than $dUV_{IO}$	$V_{IO}$ is above the under-voltage threshold for longer than $dB_{DRV_{IO}}$ or Wake flag becomes set	
Error	Any of the following status bits is set: • Bus error • Thermal Warning • Thermal Shutdown • TxEN Timeout • $V_{BAT}$ Under-voltage • $V_{CC}$ Under-voltage • $V_{IO}$ Under-voltage	All of the following status bits are reset: • Bus error • Thermal Warning • Thermal Shutdown • TxEN Timeout • $V_{BAT}$ Under-voltage • $V_{CC}$ Under-voltage • $V_{IO}$ Under-voltage	

### Operating Mode Changes Caused by Internal Flags

Changes of some internal flags described in Table 3 can force an operating mode transition complementing or overruling the operating mode control by the digital inputs STBN and EN which is shown in Figure 3:

- Setting the  $V_{BAT}$  or  $V_{IO}$  under-voltage flag causes a transition to the Sleep mode
- Setting the  $V_{CC}$  under-voltage flag, while the bus driver is not in Sleep, causes a transition to the Standby mode
- Reset of the Under-voltage flag (i.e. recovery from under-voltage) re-enables the control of the chip by digital inputs STBN and EN.
- Setting of the Wake flag causes the reset of all under-voltage flags and the NCV7381 transitions to the Standby mode. The reset of the under-voltage flags allows the external power supplies to stabilize properly if, for example, they were previously switched off during Sleep mode.

### FlexRay Bus Driver

NCV7381 contains a fully-featured FlexRay bus driver compliant with Electrical Physical Layer Specification Rev. 3.0.1. The transmitter part translates logical signals on digital inputs TxEN, BGE and TxD into appropriate bus levels on pins BP and BM. A transmission cannot be started with Data\_1. In case the transmitter is enabled for longer than *dBDTxActiveMax*, the TxEN Timeout flag is set and the current transmission is disabled. The receiver part monitors bus pins BP and BM and signals the detected levels on digital outputs RxD and RxEN. The different bus levels are defined in Figure 5. The function of the bus driver and the related digital pins in different operating modes is detailed in Table 4 and Table 5.

- The transmitter can only be enabled if the activation of the transmitter is initiated in Normal mode.
- The receiver function is enabled by entering a normal-power mode.

	x	set	Low	Low
Normal, Receive-only	Idle	x	High	High
	Data_0	x	Low	Low
	Data_1	x	High	Low

### Bus Guardian Interface

The interface consists of the BGE digital input signal allowing a Bus Guardian unit to disable the transmitter and of the RxEN digital output signal used to signal whether the communication signal is Idle or not.

### Bus Driver Voltage Regulator Control

NCV7381 provides a high-voltage output pin INH which can be used to control an external voltage regulator (see Figure 2). The pin INH is driven by a switch to  $V_{BAT}$  supply. In Normal, Receive-only, Standby and Go-to-Sleep modes, the switch is activated thus forcing a High level on pin INH. In the Sleep mode, the switch is open and INH pin remains floating. If a regulator is directly controlled by INH, it is then active in all operating modes with the exception of the Sleep mode.

### Bus Driver Remote Wakeup Detection

During a low-power mode and under the presence of  $V_{BAT}$  voltage, a low-power receiver constantly monitors the activity on bus pins BP and BM. A valid remote wake-up is detected when either a wakeup pattern or a dedicated wakeup frame is received. A valid remote wake-up is also detected when wakeup pattern has been started in normal-power mode already.

A wakeup pattern is composed of two Data\_0 symbols separated by Data\_1 or Idle symbols. The basic wakeup pattern composed of Data\_0 and Idle symbols is shown in Figure 6; the wakeup pattern composed of Data\_0 and Data\_1 symbols – referred to as “alternative wakeup pattern” – is depicted in Figure 7.

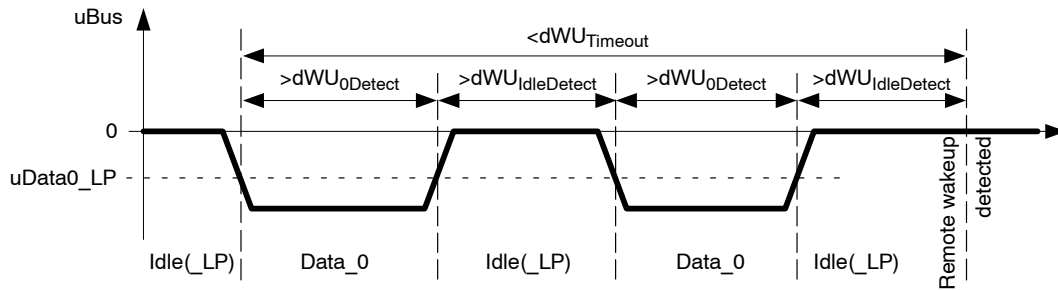

Figure 6. Valid Remote Wakeup Pattern

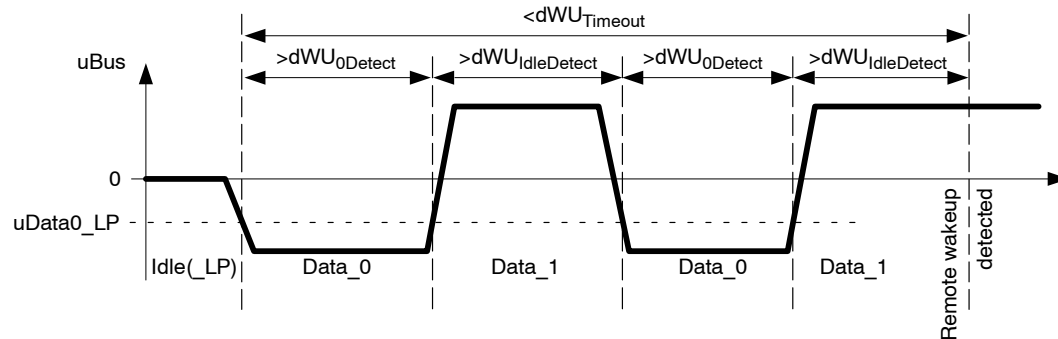

Figure 7. Valid Alternative Remote Wakeup Pattern

A remote wakeup will be also detected if NCV7381 receives a full FlexRay frame at 10 Mbit/s with the following payload data:

```
0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0x00, 0x00, 0x00, 0x00, 0x00,
0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0x00, 0x00, 0x00, 0x00, 0x00,
0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0x00, 0x00, 0x00, 0x00, 0x00,
0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0xFF
```

The wakeup pattern, the alternative wakeup pattern and the wakeup frame lead to identical wakeup treatment and signaling.

### Local Wakeup Detection

The high-voltage input WAKE is monitored in low-power modes and under the condition of sufficient  $V_{BAT}$  supply level. If a falling edge is recognized on WAKE pin, a local wakeup is detected. In order to avoid false wakeups, the Low level after the falling edge must be longer than  $dWakePulseFilter$  in order for the wakeup to be valid. The WAKE pin can be used, for example, for switch or contact monitoring.

Internal pull-up and pull-down current sources are connected to WAKE pin in order to minimize the risk of parasitic toggling. The current source polarity is automatically selected based on the WAKE input signal polarity – when the voltage on WAKE stays stable High (Low) for longer than  $dWakePulseFilter$ , the internal current source is switched to pull-up (pull-down).

### ERRN Pin and Status Register

Provided  $V_{IO}$  supply is present together with either  $V_{BAT}$  or  $V_{CC}$ , the digital output ERRN indicates the state of the internal “Error” flag when in Normal mode and the state of the internal “Wake” flag when in Standby, Go-to-Sleep or Sleep. In Receive-only mode ERRN indicates either the

state of the internal “Error” or the wakeup source (See Table 6).

The polarity of the indication is reversed – ERRN pin is pulled Low when the “Error” flag is set. The signaling on pin ERRN functions in all operating modes.

**Table 6. SIGNALING ON ERRN PIN**

STBN	EN	Conditions	Error flag	Wake flag	ERRN
High	High	–	not set	x	High
			set	x	Low
High	Low	EN has been set to High after previous wakeup	not set	x	High
			set	x	Low
		EN has not been set to High after previous wakeup	x	Set local	High
			x	Set remote	Low
Low	x	–	x	not set	High
			x	set	Low

Additionally, a full set of internal bits referred to as status register can be read through ERRN pin with EN pin used as a clock signal – the status register content is described in Table 7 while an example of the read-out waveforms is shown in Figure 8 and Figure 9. The individual status bits are channeled to ERRN pin with reversed polarity (if a status bit is set, ERRN is pulled Low) at the falling edge on EN pin (the status register starts to be shifted only at the second falling edge). As long as the EN pin toggling period falls in the  $dEN_{STAT}$  range, the operating mode is not changed and the

read-out continues. As soon as the EN level is stable for more than  $dBDModeChange$ , the read-out is considered as finished and the operating mode is changed according the current EN value. At the same time, the status register bits S4 to S10 are reset provided the particular bits have been read-out and the corresponding flags are not set any more – see Table 7. The status register read-out always starts with bit S0 and the exact number of bits shifted to ERRN during the read-out is not relevant.

**Table 7. STATUS REGISTER**

Bit Number	Status Bit Content	Note	Reset after Finished Read-out
S0	Local wakeup flag	reflects directly the corresponding flag	no
S1	Remote wakeup flag		
S2	not used; always High		
S3	Power-on status	the status bit is set if the corresponding flag was set previously (the respective High level of the flag is latched in its status counter-part)	yes, if the corresponding flag is reset and the bit was read-out
S4	Bus error status		
S5	Thermal shutdown status		
S6	Thermal warning status		
S7	TxEN Timeout status		
S8	$V_{BAT}$ Under-voltage status
