APPLICATION INFORMATION

Dead Battery

FSA4476 supports dead battery application. When power is not applied to FSA4476 and it is attached to a Source device, then the Source would pull up the CC line connected through the cable. FSA4476 in response would turn on the pull-down that will bring the CC voltage to a range that the Source can detect an attach event and turn on VBUS.

Headset detection

FSA4476 integrates headset unplug detection function by detecting the CCx_H voltage. The headset detection is only active during audio switch on status(EN1 = 1). When headset is attached (both CC1_H and CC2_H are Low), the flag signal is sent low to host controller by INT1 (INT1 = low). Once either of CCx_H = High (CCx_H > 1.5 V), INT1 will be released to high by external pull up resistor.
