

NCV7420

LIN Transceiver with 3.3 V or 5 V Voltage Regulator

General Description

The NCV7420 is a fully featured local interconnect network (LIN) transceiver designed to interface between a LIN protocol controller and the physical bus. The transceiver is implemented in I3T technology enabling both high-voltage analog circuitry and digital functionality to co-exist on the same chip.

The NCV7420 LIN device is a member of the in-vehicle networking (IVN) transceiver family of ON Semiconductor that integrates a LIN v2.0/2.1 physical transceiver and either a 3.3 V or a 5 V voltage regulator.

The LIN bus is designed to communicate low rate data from control devices such as door locks, mirrors, car seats, and sunroofs at the lowest possible cost. The bus is designed to eliminate as much wiring as possible and is implemented using a single wire in each node. Each node has a slave MCU-state machine that recognizes and translates the instructions specific to that function. The main attraction of the LIN bus is that all the functions are not time critical and usually relate to passenger comfort.

KEY FEATURES

LIN-Bus Transceiver

- LIN compliant to specification revision 2.0 and 2.1 (backward compatible to version 1.3) and J2602
- I3T high voltage technology
- Bus voltage ± 45 V
- Transmission rate up to 20 kBaud

Protection

- Thermal shutdown
- Indefinite short-circuit protection on pins LIN and WAKE towards supply and ground
- Load dump protection (45 V)
- Bus pins protected against transients in an automotive environment
- System ESD protection level for LIN, WAKE and V_{BB} up to ± 12 kV

Voltage Regulator

- Output voltage 5 V / ~ 50 mA or 3.3 V / ~ 50 mA
- Wake-up input
- Enable inputs for standby and sleep mode
- INH output for auxiliary purposes (switching of an external pull-up or resistive divider towards battery, control of an external voltage regulator etc.)

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 19 of this data sheet.

EMI Compatibility

- Integrated slope control
- Meets most demanding EMS/EME requirements

Modes

- Normal mode: LIN communication in either low (up to 10 kBaud) or normal slope
- Sleep mode: V_{CC} is switched “off” and no communication on LIN bus
- Standby mode: V_{CC} is switched “on” but there is no communication on LIN bus
- Wake-up bringing the component from sleep mode into standby mode is possible either by LIN command or digital input signal on WAKE pin. Wake-up from LIN bus can also be detected and flagged when the chip is already in standby mode.

Quality

- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

- Below 5 V on V_{BB} in normal mode, the bus will either stay recessive or comply with the voltage level specifications and transition time specifications as required by SAE J2602. It is ensured by the battery monitoring circuit.
- The applied transients shall be in accordance with ISO 7637 part 1, test pulse 5. The device complies with functional class C; class A can be reached depending on the application and external conditions.
- Thermal aspects of the entire end-application have to be taken into account in order to avoid thermal shutdown of NCV7420.
- V_{CC} voltage regulator output must be properly decoupled by external capacitor of min. 8 μF with ESR < 1 Ω to ensure stability.

Typical Application

Application Schematic

The EMC immunity of the Master-mode device can be further enhanced by adding a capacitor between the LIN output and ground. The optimum value of this capacitor is

determined by the length and capacitance of the LIN bus, the number and capacitance of Slave devices, the pull-up resistance of all devices (Master & Slave), and the required time constant of the system, respectively.

V_{CC} voltage must be properly stabilized by external capacitor: capacitor of min. 8 μF (ESR < 1 Ω).

Overall Functional Description

LIN is a serial communication protocol that efficiently supports the control of mechatronic nodes in distributed automotive applications. The domain is class-A multiplex buses with a single master node and a set of slave nodes.

NCV7420 is designed as a master or slave node for the LIN communication interface with an integrated 3.3 V or 5 V voltage regulator having a current capability up to 50 mA for supplying any external components (microcontroller).

NCV7420 contains the LIN transmitter, LIN receiver, voltage regulator, power-on-reset (POR) circuits and thermal shutdown (TSD). The LIN transmitter is optimized for the maximum specified transmission speed of 20 kBaud

with EMC performance due to reduced slew rate of the LIN output.

The junction temperature is monitored via a thermal shutdown circuit that switches the LIN transmitter and voltage regulator off when temperature exceeds the TSD trigger level.

NCV7420 has four operating states (normal mode, low slope mode, standby mode, and sleep mode) that are determined by the input signals EN, WAKE, STB, and TxD.

Operating States

NCV7420 provides four operating states, two modes for normal operation with communication, one standby without communication and one low power mode with very low current consumption. See Figure 3.

Figure 3. State Diagram

Table 5. MODE SELECTION

| Mode | V _{CC} | RxD | INH | LIN | 30 kΩ on LIN | Note |
|--------------------|-----------------|--|--|--------------|--------------|------------------|
| Normal – Slope | ON | Low = Dominant State High = Recessive State | High if STB=High during state transition; Floating otherwise | Normal Slope | ON | (Note 7) |
| Normal – Low Slope | ON | Low = Dominant State High = Recessive State | High if STB=High during state transition; Floating otherwise | Low Slope | ON | (Note 8) |
| Standby | ON | Low after LIN wake-up, high otherwise | Floating | OFF | OFF | (Notes 9 and 10) |
| Sleep | OFF | Clamped to V _{CC} | Floating | OFF | OFF | |

- The normal slope mode is entered when pin EN goes HIGH while TxD is in HIGH state during EN transition.
- The low slope mode is entered when pin EN goes HIGH while TxD is in LOW state during EN transition. LIN transmitter gets on only after TxD returns to high after the state transition.
- The standby mode is entered automatically after power-up.
- In standby mode, RxD High state is achieved by internal pull-up resistor to V_{CC}.

Normal Slope Mode

In normal slope mode the transceiver can transmit and receive data via LIN bus with speed up to 20 kbaud. The transmit data stream of the LIN protocol is present on the TxD pin and converted by the transmitter into a LIN bus signal with controlled slew rate to minimize EMC emission. The receiver consists of the comparator that has a threshold with hysteresis in respect to the supply voltage and an input filter to remove bus noise. The LIN output is pulled HIGH via an internal 30 kΩ pull-up resistor. For master applications it is needed to put an external 1 kΩ resistor with a serial diode between LIN and V_{BB} (or INH). See Figure 2. The mode selection is done by EN=HIGH when TxD pin is

HIGH. If STB pin is high during the standby-to-normal slope mode transition, INH pin is pulled high. Otherwise, it stays floating.

Low Slope Mode

In low slope mode the slew rate of the signal on the LIN bus is reduced (rising and falling edges of the LIN bus signal are longer). This further reduces the EMC emission. As a consequence the maximum speed on the LIN bus is reduced up to 10 kbaud. This mode is suited for applications where the communication speed is not critical. The mode selection is done by EN=HIGH when TxD pin is LOW. In order not to transmit immediately a dominant state on the bus (because

TxD=LOW), the LIN transmitter is enabled only after TxD returns to HIGH. If STB pin is high during the standby-to-low slope mode transition, INH pin is pulled high. Otherwise, it stays floating.

Standby Mode

The standby mode is always entered after power-up of the NCV7420. It can also be entered from normal mode when the EN pin is low and the standby pin is high. From sleep mode it can be entered after a local wake-up or LIN wake-up. In standby mode the V_{CC} voltage regulator for supplying external components (e.g. a microcontroller) stays active. Also the LIN receiver stays active to be able to detect a remote wake-up via bus. The LIN transmitter is disabled and the slave internal termination resistor of 30 kΩ between LIN and V_{BB} is disconnected in order to minimize current consumption. Only a pull-up current source between V_{BB} and LIN is active.

Sleep Mode

The Sleep Mode provides extreme low current consumption. This mode is entered when both EN and STB pins are LOW coming from normal mode. The internal termination resistor of 30 kΩ between LIN and V_{BB} is disconnected and also the V_{CC} regulator is switched off to minimize current consumption.

Wake-up

NCV7420 has two possibilities to wake-up from sleep or standby mode (see Figure 3):

- Local wake-up: enables the transition from sleep mode to standby mode
- Remote wake-up via LIN: enables the transition from sleep- to standby mode and can be also detected when already in standby mode.

A local wake-up is **only** detected in sleep mode if a transition from LOW to HIGH or from HIGH to LOW is seen on the WAKE pin.

Figure 4. Local Wake-up Signal

A remote wake-up is **only** detected if a combination of (1) a falling edge at the LIN pin (transition from recessive to dominant) is followed by (2) a dominant level maintained

for a time period > t_{WAKE} and (3) again a rising edge at pin LIN (transition from dominant to recessive) happens.

Figure 5. Remote Wake-up Behavior

The wake-up source is distinguished by pin RxD in the standby mode:

- RxD remains HIGH after power-up or local wake-up.

- RxD is kept LOW until normal mode is entered after a remote wake-up (LIN).

23. The voltage drop in Normal mode between LIN and V_{BB} pin is the sum of the diode drop and the drop at serial pull-up resistor. The drop at the switch is negligible. See Figure 1.

24. By one of the trimming bits, following reconfiguration can be done during chip-level testing in order to fit the NCV7420-5 into different interface: pins TxD and EN will have typ. $10\ \text{k}\Omega$ pull-down resistor to ground and pin WAKE will have typ. $10\ \mu\text{A}$ pull-up current source.

25. Guaranteed by design. Not tested.

26. V_{BB} undervoltage threshold is always higher than V_{BB} POR low level ($V_{BB_UV_th} > \text{PORL_}V_{BB}$)

27. Measured at output voltage $V_{CC_OUT} = (V_{CC_OUT}@V_{BB} = 6\text{ V}) - 2\%$.

28. Values based on design and characterization. Not tested in production.

SOIC-14 CASE 751AP ISSUE B

DATE 18 MAY 2015

- NOTES:
1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
 2. CONTROLLING DIMENSION: MILLIMETERS.
 3. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE PROTRUSION SHALL BE 0.004 mm IN EXCESS OF MAXIMUM MATERIAL CONDITION.
 4. DIMENSION D DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS OR GATE BURRS. MOLD FLASH, PROTRUSIONS OR GATE BURRS SHALL NOT EXCEED 0.006 mm PER SIDE. DIMENSION E1 DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION. INTERLEAD FLASH OR PROTRUSION SHALL NOT EXCEED 0.010 mm PER SIDE.
 5. THE PACKAGE TOP MAY BE SMALLER THAN THE PACKAGE BOTTOM. DIMENSIONS D AND E1 ARE DETERMINED AT THE OUTER-MOST EXTREMES OF THE PLASTIC BODY AT DATUM H.
 6. DIMENSIONS A AND B ARE TO BE DETERMINED AT DATUM H.
 7. DIMENSIONS b AND c APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10 TO 0.25 FROM THE LEAD TIP.
 8. A1 IS DEFINED AS THE VERTICAL DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT ON THE PACKAGE BODY.
