OVERVIEW

Circuit Description

AX-SFUS and AX-SFUS-API are ultra-low power single chip solutions for a node on the Sigfox network with both up- and down-link functionality. The AX-SFUS chip is delivered fully ready for operation and contains all the necessary firmware to transmit and receive data from the Sigfox network in the US (SIGFOX RCZ2 region). It connects to the customer product using a logic level RS232 UART. AT commands are used to send frames and configure radio parameters.

The AX-SFUS-API variant is intended for customers wishing to write their own application software based on the AX-SF-LIB-1-GEVK library.

AX-SFUS, AX-SFUS-API

AT\$CB=0011223344,1

OK

RX=AA BB CC DD

This sends a Sigfox frame containing { 0xAA : 0xBB : 0x12 : 0x34 } without waiting for a response telegram.

AT\$CB=0xAA,1

OK

The 'CB' command sends out a continuous pattern of bits, in this case 0xAA = 0b10101010.

AT\$P=1

OK

This transitions the device into sleep mode. Out-of-band transmissions will still be triggered. The UART is powered down. The device can be woken up by a low level on the UART signal, i.e. by sending break.

In differential mode, the full scale range may also be specified as 1 V or 10 V. Note however that the pin input voltages must not exceed the range 0..VDD_IO. The command returns the result as fraction of the full scale range (1 V if none is specified). The GPIO pins referenced should be initialized to analog mode before issuing this command.

AT:CLK?	Get Clock Generator	Return the settings of the clock generator. Two numbers are returned, freq and refreq.															
AT:DAC=value	Set $\Sigma\Delta$ DAC	Output a $\Sigma\Delta$ DAC value on the pin(s) set to T mode. Parameter value may be in the range -32768...32767. The average output voltage is $(1/2 + \text{value} / 2^{17}) \times VDD$. An external low pass filter is needed to get smooth output voltages. The modulation frequency is 20 MHz. A possible low pass filter choice is a simple RC low pass filter with R = 10 k Ω and C = 1 μ F.															
AT:DAC=OFF	Turn off $\Sigma\Delta$ DAC	Switch off the DAC															
AT:DAC?	Get $\Sigma\Delta$ DAC	Return the DAC value

QFN40 Recommended Pad Layout

1. PCB land and solder masking recommendations are shown in Figure 7.

- A = Clearance from PCB thermal pad to solder mask opening, 0.0635 mm minimum
- B = Clearance from edge of PCB thermal pad to PCB land, 0.2 mm minimum
- C = Clearance from PCB land edge to solder mask opening to be as tight as possible to ensure that some solder mask remains between PCB pads.
- D = PCB land length = QFN solder pad length + 0.1 mm
- E = PCB land width = QFN solder pad width + 0.1 mm

Figure 7. PCB Land and Solder Mask Recommendations

2. Thermal vias should be used on the PCB thermal pad (middle ground pad) to improve thermal conductivity from the device to a copper ground plane area on the reverse side of the printed circuit board. The number of vias depends on the package thermal requirements, as determined by thermal simulation or actual testing.
3. Increasing the number of vias through the printed circuit board will improve the thermal conductivity to the reverse side ground plane and external heat sink. In general, adding more metal through the PCB under the IC will improve operational heat transfer, but will require careful attention to uniform heating of the board during assembly.

Assembly Process

Stencil Design & Solder Paste Application

1. Stainless steel stencils are recommended for solder paste application.
2. A stencil thickness of 0.125 – 0.150 mm (5 – 6 mils) is recommended for screening.

3. For the PCB thermal pad, solder paste should be printed on the PCB by designing a stencil with an array of smaller openings that sum to 50% of the QFN exposed pad area. Solder paste should be applied through an array of squares (or circles) as shown in Figure 8.
4. The aperture opening for the signal pads should be between 50–80% of the QFN pad area as shown in Figure 9.
5. Optionally, for better solder paste release, the aperture walls should be trapezoidal and the corners rounded.
6. The fine pitch of the IC leads requires accurate alignment of the stencil and the printed circuit board. The stencil and printed circuit assembly should be aligned to within + 1 mil prior to application of the solder paste.
7. No-clean flux is recommended since flux from underneath the thermal pad will be difficult to clean if water-soluble flux is used.
