

Autonomous USB Type-C Controller with Configurable I²C Address

FUSB301A

Description

The FUSB301A is a fully autonomous Type-C controller optimized for <15 W applications. The FUSB301A offers CC logic detection for Source Mode, Sink Mode, DRP, accessory detection support, and dead battery support. The FUSB301A features configurable I²C address to support multiple ports per system. The FUSB301A features an extremely low power disable mode as well as low power during normal operation. It is available in an ultra thin, 12-Lead TMLP Package.

Features

- Fully Autonomous Type-C Controller Supports Type-C Versions 1.1 and 1.0
- V_{DD} Operating Range, 3.0 V – 5.5 V
- Low Disable Power: I_{CC} = 2.0 μA (Max.)
- Low Standby Power: I_{CC} = 7.0 μA (Max.)
- DRP Mode with Optional Accessory Support
- Configurable I²C Address
- Capable of Supporting Try.SNK and Try.SRC
- Dead Battery Support (SINK Support when No Power Applied)
- 2 kV HBM ESD Protection
- Small Packaging, 12 Lead TMLP (1.6 mm × 1.6 mm × 0.375 mm)

Applications

- Smartphones
- Tablets
- Notebooks
- Ultra Portable Applications

PIN DESCRIPTIONS

Pin #	Name	Type	Description
USB Type-C Connector Interface			
1, 2	CC1, CC2	I/O	Type-C Configuration Channel
4	VBUS	Input	VBUS input pin for attach and detach detection
10	GND	Ground	Ground
Power Interface			
12	VDD	Power	Input Supply Voltage
Signal Interface			
8	SCL	Input	I ² C serial clock signal to be connected to the I ² C master
7	SDA	Open-Drain I/O	I ² C serial data signal to be connected to the I ² C master
6	INT_N	Open-Drain Output	Active LOW open drain interrupt output used to prompt the processor to read the I ² C register bits
9	ID	Open-Drain Output	Used to Identify if connected device is Source or Sink. The ID Pin can be used to interface with USB 2.0 Input on the processor.
5	I2CADDR	Input	Used to change bit 3 of the I2C address so that multiple addresses can be used in a system where two device addresses conflict
3	NC1	NC	No Connect – Tie to Ground or Float
11	NC2	NC	No Connect – Tie to Ground or Float

Dead Battery

If power is not applied to FUSB301A and it is attached to a Source device, then the Source would pull up the CC line connected through the cable. The FUSB301A in response would turn on the pull-down that will bring the CC voltage to a range that the Source can detect an attach and turn on VBUS.

Power Up, Initialization and Reset, Interrupt Operation

When power is first applied, the FUSB301A will power up in Sink mode with all interrupts masked. The local processor must configure the FUSB301A to the desired mode and clear the global interrupt mask bit, INT_MASK. The INT_N pin is an active low, open drain output. This pin indicates to the host processor that an interrupt has occurred in the FUSB301A which needs attention. The INT_N pin is

in a high impedance state by default after power-up or device reset, and the global interrupt mask (INT_MASK in Control register) is set. After INT_MASK bit is cleared by the local processor, the INT_N pin stays high impedance in preparation of future interrupts. When an interruptible event occurs, INT_N is driven LOW and is in a high impedance state again when the processor clears the interrupt by reading the interrupt registers. Subsequent to the initial power up or reset; if the processor writes a “1” to global interrupt mask bit when the system is already powered up, the INT_N pin stays in a high impedance state and ignores all interrupts until the global interrupt mask bit is cleared. If an event happens that would ordinarily cause an interrupt when the global interrupt mask bit is set, the INT_N pin goes LOW when the global interrupt mask is cleared.

3. Guaranteed by characterization. Not production tested.
4. A fast-mode I²C bus device can be used in a standard-mode I²C bus system, but the requirement $t_{SU;DAT} \geq 250$ ns must be met. This is automatically the case of the device does not stretch the LOW period of the I2C_SCL signal. If such a device does stretch the LOW period I2C_SCL signal, it must output the next data bit to the I2C_SDA line $t_{r_max} + t_{SU;DAT} = 1000 + 250 = 1250$ ns (according to the standard-mode I²C bus specification) before the I2C_SCL line is released.
5. Cb equals the total capacitance of one bus line in pF. If mixed with high-speed devices, faster fall times are allowed according to the I²C specification.

I²C INTERFACE

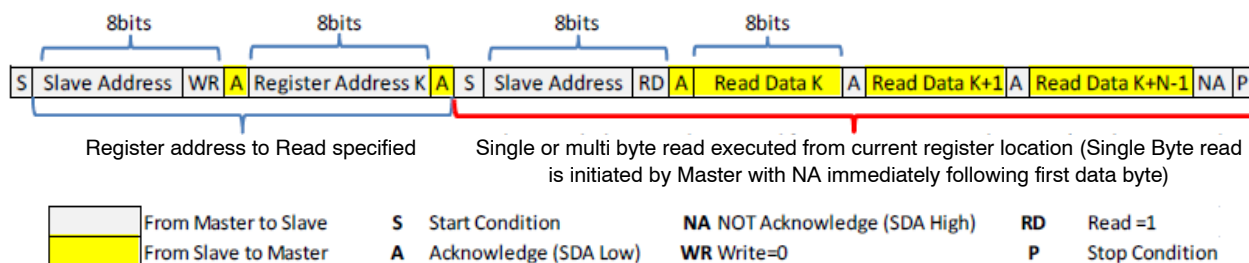

The FUSB301A includes a full I²C slave controller. The I²C slave fully complies with the I²C specification version 6

requirements. This block is designed for fast mode. Examples of an I²C write and read sequence are shown Figure 5 and Figure 6 respectively.

NOTE: Single Byte read is initiated by Master with P immediately following first data byte.

Figure 5. I²C Write Example

NOTE: If Register is not specified Master will begin read from current register. In this case only sequence showing in Red bracket is needed.
