Level Translator, 1-Bit Bidirectional

Configurable Voltage Supplies and Bushold Data Inputs

FXLH1T45

SIP6 1.45x1.0
CASE 127EB

The FXLH1T45 is a single bit configurable dual-voltage supply translator designed for both uni-directional and bi-directional voltage translation between two logic levels. The device allows translation between voltages as high as 3.6 V to as low as 1.1 V. The A port tracks the V_{CCA} level, and the B port tracks the V_{CCB} level. This allows for bi-directional voltage translation over a variety of voltage levels: 1.2 V, 1.5 V, 1.8 V, 2.5 V and 3.3 V.

The device remains in 3-STATE until both V_{CC}s reach active levels allowing either V_{CC} to be powered-up first. Internal power down control circuits place the device in 3-STATE if either V_{CC} is removed.

The Transmit/Receive (T/$\overline{R}$) input determines the direction of data flow through the device. The FXLH1T45 is designed so that the control pin (T/$\overline{R}$) is supplied by V_{CCA}.

Features

- Bi-directional Interface between any 2 Levels from 1.1 V to 3.6 V
- Fully Configurable: Inputs Track V_{CC} level
- Non-preferential Power-up Sequencing; either V_{CC} may be Powered-up First
- Outputs Remain in 3-STATE until Active V_{CC} Level is Reached
- Outputs Switch to 3-STATE if either V_{CC} is at GND
- Power Off Protection
- Bushold On Data Inputs Eliminates the Need for External Pull-up/Pull-down Resistors
- Control Input (T/$\overline{R}$) Levels are Referenced to V_{CCA} Voltage
- Packaged in the MicroPak 6 SIP6 (1.0 mm x 1.45 mm)
- ESD Protections Exceeds:
  - 4 kV HBM ESD (per JESD22-A114 & Mil Std 883e 3015.7)
  - 8 kV HBM I/O to GND ESD (per JESD22-A114 & Mil Std 883e 3015.7)
  - 1 kV CDM ESD (per ESD STM 5.3)
  - 200 V MM ESD (per JESD22-A115 & ESD STM5.2)

POWER-UP/POWER-DOWN SEQUENCING

FXL translators offer an advantage in that either V_{CC} may be powered up first. This benefit derives from the chip design. When either V_{CC} is at 0V, outputs are in a HIGH-Impedance state. To ensure that bus contention, excessive currents, or oscillations do not occur, a proper power-up sequence is recommended.

The recommended power-up sequence is the following:

1. Apply power to either V_{CC}
2. Apply power to the T/$\overline{R}$ input (Logic HIGH for A-to-B operation; Logic LOW for B-to-A operation) and to the respective data inputs (A Port or B Port). This may occur at the same time as Step 1
3. Apply power to other V_{CC}

The recommended power-down sequence is the following:

4. Remove power from either V_{CC}
5. Remove power from other V_{CC}

NOTES:

8. The enable time, t_{PZH} or t_{PZL}, is the time for the FXLH1T45 to return to active operation after a direction change. The enable time specifies the worst-case delay from the time the T/$\overline{R}$ pin is switched until a valid output signal is expected. For example, to change direction to B-to-A operation, the T/$\overline{R}$ pin is switched from HIGH-to-LOW. The enable time for this case is found by adding the disable time for T/$\overline{R}$ to B to the propagation delay for B to A. The formulas for calculating enable times are the following:
   t_{PZH} (T/$\overline{R}$ to A) = t_{PLZ} (T/$\overline{R}$ to B) + t_{PLH} (B to A)
   t_{PZL} (T/$\overline{R}$ to A) = t_{PHZ} (T/$\overline{R}$ to B) + t_{PHL} (B to A)
   t_{PZH} (T/$\overline{R}$ to B) = t_{PLZ} (T/$\overline{R}$ to A) + t_{PLH} (A to B)
   t_{PZL} (T/$\overline{R}$ to B) = t_{PHZ} (T/$\overline{R}$ to A) + t_{PHL} (A to B)

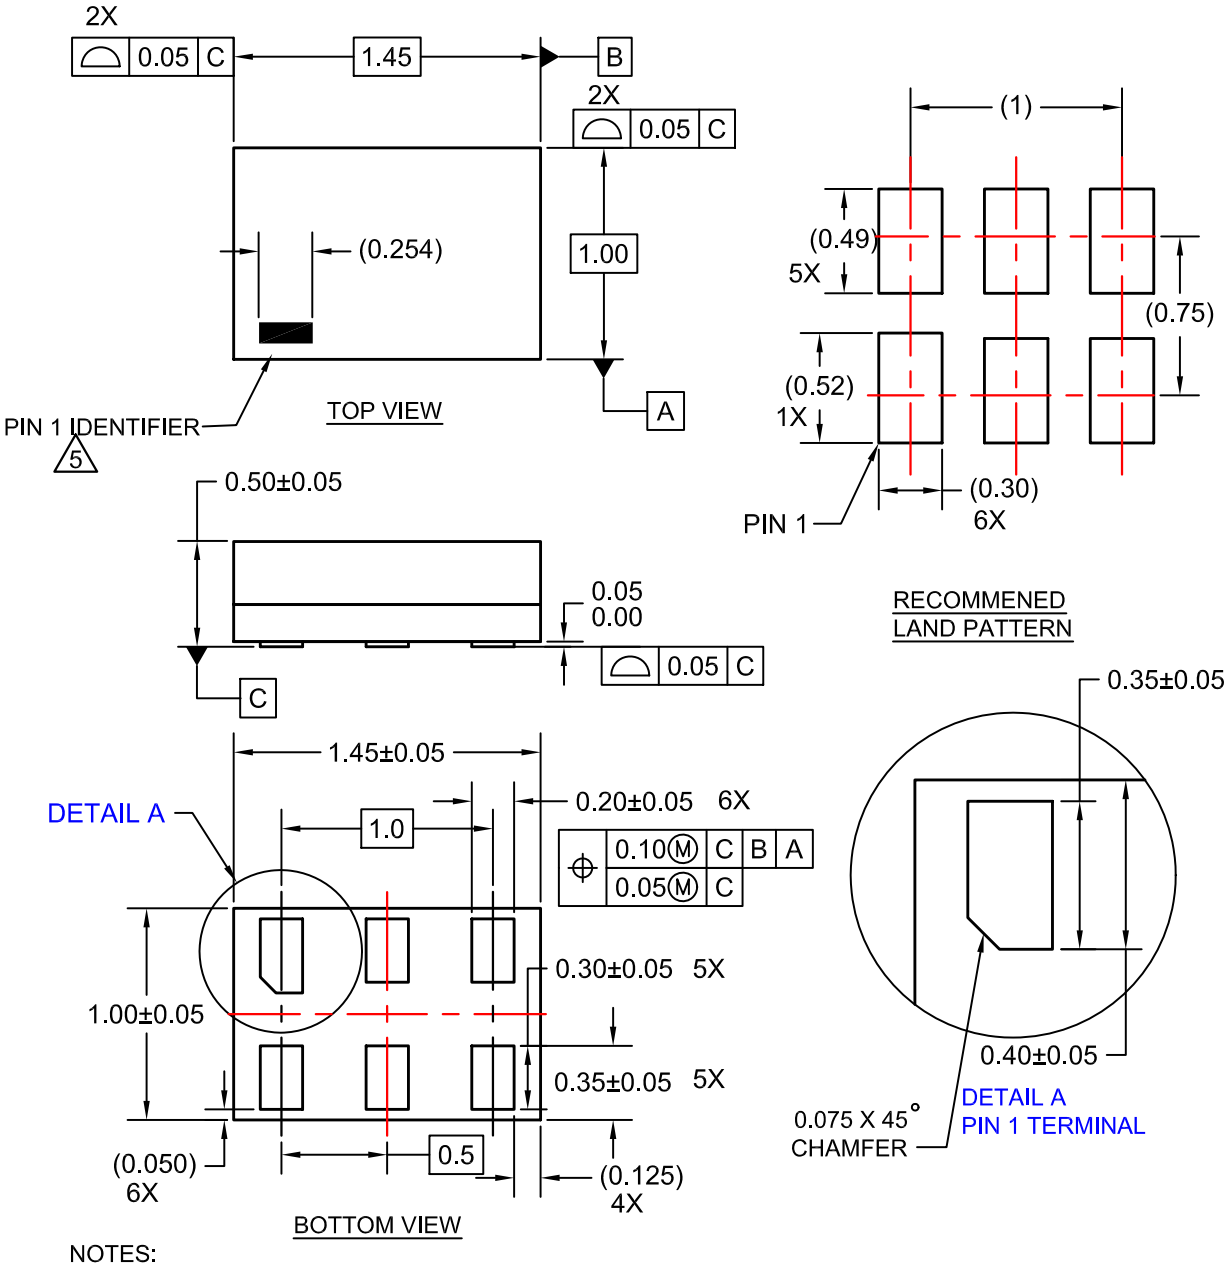
CASE 127EB
ISSUE O

DATE 31 AUG 2016



NOTES:

1. CONFORMS TO JEDEC STANDARD MO-252 VARIATION UAAD
2. DIMENSIONS ARE IN MILLIMETERS
3. DRAWING CONFORMS TO ASME Y14.5M-2009
4. PIN ONE IDENTIFIER IS 2X LENGTH OF ANY OTHER LINE IN THE MARK CODE LAYOUT.
