

1.8 V/2.5 V, 10 GHz ÷4 Clock Divider with CML Outputs

Multi-Level Inputs w/ Internal Termination

NB7V33M

Description

The NB7V33M is a differential ÷4 Clock divider with asynchronous reset. The differential Clock inputs incorporate internal 50 Ω termination resistors and will accept LVPECL, CML and LVDS logic levels. The NB7V33M produces a +4 output copy of an input Clock operating up to 10 GHz with minimal jitter. The Reset pin is asserted on the rising edge. Upon powerup, the internal flip-flops will attain a random state; the Reset allows for the synchronization of multiple NB7V33M's in a system. The 16 mA differential CML output provides matching internal 50 Ω termination which guarantees 400 mV output swing when externally receiver terminated with 50 Ω to V_{CC}.

The NB7V33M is the ÷4 version of the NB7V32M (÷2) and is offered in a low profile 3 mm x 3 mm 16-pin QFN package.

The NB7V33M is a member of the GigaComm™ family of high performance clock products. Application notes, models, and support documentation are available at www.onsemi.com.

11. Measured using a 1 GHz, $V_{INPPmin}$, 50% duty-cycle clock source. All output loading with external $50\ \Omega$ to V_{CC} . Input edge rates 40 ps (20% – 80%).

12. Output voltage swing is a single-ended measurement operating in differential mode.

13. Duty cycle skew is defined only for differential operation when the delays are measured from cross-point of the inputs to the cross-point of the outputs. Duty cycle skew is measured between differential outputs using the deviations of the sum of T_{pw-} and T_{pw+} @ 1 GHz. Skew is measured between outputs under identical transitions and conditions.

14. Additive RMS jitter with 50% duty cycle clock signal.

15. Input voltage swing is a single-ended measurement operating in differential mode.
