## LDO Linear Regulator - Micropower, DELAY, Adjustable RESET, Sense Output

### 5.0 V, 150 mA

The NCV4269C is a 5.0 V precision micropower voltage regulator with an output current capability of 150 mA.

The output voltage is accurate within  $\pm 2.0\%$  with a maximum dropout voltage of 0.5 V at 100 mA. Low quiescent current is a feature drawing only 125  $\mu\text{A}$  with a 1.0 mA load. This part is ideal for any and all battery operated microprocessor equipment.

Microprocessor control logic includes an active reset output RO with delay and a SI/SO monitor which can be used to provide an early warning signal to the microprocessor of a potential impending reset signal. The use of the SI/SO monitor allows the microprocessor to finish any signal processing before the reset shuts the microprocessor down.

The active Reset circuit operates correctly at an output voltage as low as 1.0 V. The Reset function is activated during the power up sequence or during normal operation if the output voltage drops outside the regulation limits.

The reset threshold voltage can be decreased by the connection of an external resistor divider to the  $R_{\text{ADJ}}$  lead. The regulator is protected against reverse battery, short circuit, and thermal overload conditions. The device can withstand load dump transients making it suitable for use in automotive environments. The device has also been optimized for EMC conditions.

#### Features

- 5.0 V  $\pm 2.0\%$  Output
- Low 125  $\mu\text{A}$  Quiescent Current
- Active Reset Output Low Down to  $V_{\text{O}} = 1.0 \text{ V}$
- Adjustable Reset Threshold
- 150 mA Output Current Capability
- Fault Protection
  - ◆ +60 V Peak Transient Voltage
  - ◆ -40 V Reverse Voltage
  - ◆ Short Circuit
  - ◆ Thermal Overload
- Early Warning through SI/SO Leads
- Internally Fused Leads in SO-14 Package
- Integrated Pullup Resistor at Logic Outputs (To Use External Resistors, Select the NCV4279C)
- Very Low Dropout Voltage
- Electrical Parameters Guaranteed Over Entire Temperature Range
- AEC-Q100 Grade 1 Qualified and PPAP Capable
- These are Pb-Free Devices

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. This device series incorporates ESD protection and exceeds the following ratings:

Human Body Model (HBM) ≤ 4.0 kV per AEC-Q100-002.

Machine Model (MM) ≤ 200 V per AEC-Q100-003.

2. Latchup tested per AEC-Q100-004.

3. Load Dump Test B (with centralized load dump suppression) according to ISO16750-2 standard. Guaranteed by design. Not tested in production. Passed Class A according to ISO16750-1.

4. +5°C/-0°C, 40 Sec Max-at-Peak, 60 - 150 Sec above 217°C.

APPLICATION DESCRIPTION

OUTPUT REGULATOR

The output is controlled by a precision trimmed reference. The PNP output has base drive quiescent current control for regulation while the input voltage is low, preventing over saturation. Current limit and voltage monitors complement the regulator design to give safe operating signals to the processor and control circuits.

RESET OUTPUT (RO)

A reset signal, Reset Output, RO, (low voltage) is generated as the IC powers up. After the output voltage  $V_Q$  increases above the reset threshold voltage  $V_{RT}$ , the delay timer D is started. When the voltage on the delay timer  $V_D$  passes  $V_{UD}$ , the reset signal RO goes high. A discharge of the delay timer  $V_D$  is started when  $V_Q$  drops and stays below the reset threshold voltage  $V_{RT}$ . When the voltage of the delay timer  $V_D$  drops below the lower threshold voltage  $V_{LD}$  the reset output voltage  $V_{RO}$  is brought low to reset the processor.

The reset output RO is an open collector NPN transistor with an internal 20 kΩ pullup resistor connected to the output Q, controlled by a low voltage detection circuit. The circuit is functionally independent of the rest of the IC, thereby guaranteeing that RO is valid for  $V_Q$  as low as 1.0 V.

RESET ADJUST ( $R_{ADJ}$ )

The reset threshold  $V_{RT}$  can be decreased from a typical value of 4.65 V to as low as 3.5 V by using an external voltage divider connected from the Q lead to the pin  $R_{ADJ}$ , as shown in Figure 21. The resistor divider keeps the voltage above the  $V_{RADJ,TH}$  (typical 1.35 V) for the desired input voltages, and overrides the internal threshold detector. Adjust the voltage divider according to the following relationship:

$$V_{RT} = V_{RADJ,TH} \cdot (R_{ADJ1} + R_{ADJ2}) / R_{ADJ2} \quad (\text{eq. 1})$$

If the reset adjust option is not needed, the  $R_{ADJ}$  pin should be connected to GND causing the reset threshold to go to its default value (typically 4.65 V).

RESET DELAY (D)

The reset delay circuit provides a delay (programmable by capacitor  $C_D$ ) on the reset output lead RO. The delay lead D provides charge current  $I_{D,C}$  (typically 6.5  $\mu\text{A}$ ) to the external delay capacitor  $C_D$  during the following times:

1. During Powerup (once the regulation threshold has been exceeded).
2. After a reset event has occurred and the device is back in regulation. The delay capacitor is set to discharge when the regulation ( $V_{RT}$ , reset threshold voltage) has been violated. When the delay capacitor discharges to  $V_{LD}$ , the reset signal RO pulls low.

SETTING THE DELAY TIME

The delay time is set by the delay capacitor  $C_D$  and the charge current  $I_D$ . The time is measured by the delay capacitor voltage charging from the low level of  $V_{DSAT}$  to the higher level  $V_{UD}$ . The time delay follows the equation:

$$t_d = [C_D (V_{UD} - V_{D,SAT})] / I_{D,C} \quad (\text{eq. 2})$$

Example:

Using  $C_D = 100 \text{ nF}$ .

Use the typical value for  $V_{D,SAT} = 0.1 \text{ V}$ .

Use the typical value for  $V_{UD} = 1.8 \text{ V}$ .

Use the typical value for Delay Charge Current  $I_D = 6.5 \mu\text{A}$ .

$$t_d = [100 \text{ nF} (1.8 - 0.1 \text{ V})] / 6.5 \mu\text{A} = 26.2 \text{ ms} \quad (\text{eq. 3})$$

\* $C_1$  required if regulator is located far from the power supply filter.

\*\*  $C_Q$  - minimum cap required for stability is 2.2  $\mu\text{F}$  while higher over/under-shoots may be expected. Cap must operate at minimum temperature expected.

Figure 21. Application Diagram

**SENSE INPUT (SI) / SENSE OUTPUT (SO) VOLTAGE MONITOR**

An on-chip comparator is available to provide early warning to the microprocessor of a possible reset signal (Figure 4). The output is from an open collector driver with an internal 20 kΩ pull up resistor to output Q. The reset signal typically turns the microprocessor off instantaneously. This can cause unpredictable results with the microprocessor. The signal received from the SO pin will allow the microprocessor time to complete its present task before shutting down. This function is performed by a comparator referenced to the band gap voltage. The actual trip point can be programmed externally using a resistor divider to the input monitor SI (Figure 21). The values for R<sub>SI1</sub> and R<sub>SI2</sub> are selected for a typical threshold of 1.20 V on the SI Pin.

**SIGNAL OUTPUT**

Figure 22 shows the SO Monitor timing waveforms as a result of the circuit depicted in Figure 21. As the output voltage (V<sub>Q</sub>) falls, the monitor threshold (V<sub>SI,Low</sub>), is crossed. This causes the voltage on the SO output to go low sending a warning signal to the microprocessor that a reset signal may occur in a short period of time. T<sub>WARNING</sub> is the time the microprocessor has to complete the function it is currently working on and get ready for the reset shutdown signal. When the voltage on the SO goes low and the RO stays high the current consumption is typically 530 μA at 1 mA load current.

**Figure 22. SO Warning Waveform Time Diagram**

**STABILITY CONSIDERATIONS**

The input capacitor C<sub>1</sub> in Figure 21 is necessary for compensating input line reactance. Possible oscillations caused by input inductance and input capacitance can be damped by using a resistor of approximately 1.0 Ω in series with C<sub>1</sub>.

The output or compensation capacitor helps determine three main characteristics of a linear regulator: startup delay, load transient response and loop stability.

The capacitor value and type should be based on cost, availability, size and temperature constraints. The aluminum electrolytic capacitor is the least expensive solution, but, if the circuit operates at low temperatures

(–25°C to –40°C), both the value and ESR of the capacitor will vary considerably. The capacitor manufacturer’s data sheet usually provides this information.

The 10 μF output capacitor C<sub>O</sub> shown in Figure 21 should work for most applications; however, it is not necessarily the optimized solution. Stability is guaranteed at C<sub>O</sub> is min 2.2 μF and max ESR is 2.5 Ω. There is no min ESR limit which was proved with MURATA’s ceramic caps GRM31MR71A225KA01 (2.2 μF, 10 V, X7R, 1206) and GRM31CR71A106KA01 (10 μF, 10 V, X7R, 1206) directly soldered between output and ground pins.

**CALCULATING POWER DISSIPATION IN A SINGLE OUTPUT LINEAR REGULATOR**

The maximum power dissipation for a single output regulator (Figure 21) is:

$$P_{D(max)} = [V_{I(max)} - V_{Q(min)}]I_{Q(max)} + V_{I(max)}I_q \text{ (eq. 4)}$$

where:

V<sub>I(max)</sub> is the maximum input voltage,

V<sub>Q(min)</sub> is the minimum output voltage,

I<sub>Q(max)</sub> is the maximum output current for the application,

and I<sub>q</sub> is the quiescent current the regulator consumes at I<sub>Q(max)</sub>.

Once the value of P<sub>D(max)</sub> is known, the maximum permissible value of R<sub>θJA</sub> can be calculated:

$$R_{\theta JA} = (150^{\circ}\text{C} - T_A) / P_D \text{ (eq. 5)}$$

The value of R<sub>θJA</sub> can then be compared with those in the package section of the data sheet. Those packages with R<sub>θJA</sub>’s less than the calculated value in equation 2 will keep the die temperature below 150°C. In some cases, none of the packages will be sufficient to dissipate the heat generated by the IC, and an external heatsink will be required. The current flow and voltages are shown in the Measurement Circuit Diagram.

**HEATSINKS**

A heatsink effectively increases the surface area of the package to improve the flow of heat away from the IC and into the surrounding air.

Each material in the heat flow path between the IC and the outside environment will have a thermal resistance. Like series electrical resistances, these resistances are summed to determine the value of R<sub>θJA</sub>:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CS} + R_{\theta SA} \text{ (eq. 6)}$$

where:

R<sub>θJC</sub> = the junction-to-case thermal resistance,

R<sub>θCS</sub> = the case-to-heat sink thermal resistance, and

R<sub>θSA</sub> = the heat sink-to-ambient thermal resistance.

R<sub>θJC</sub> appears in the package section of the data sheet. Like R<sub>θJA</sub>, it too is a function of package type. R<sub>θCS</sub> and R<sub>θSA</sub> are functions of the package type, heatsink and the interface between them. These values appear in data sheets of heatsink manufacturers. Thermal, mounting, and heatsinking considerations are discussed in the ON Semiconductor application note AN1040/D, available on the ON Semiconductor website.

CASE 751A-03  
ISSUE L

DATE 03 FEB 2016

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS.
3. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE PROTRUSION SHALL BE 0.13 TOTAL IN EXCESS OF AT MAXIMUM MATERIAL CONDITION.
4. DIMENSIONS D AND E DO NOT INCLUDE MOLD PROTRUSIONS.
5. MAXIMUM MOLD PROTRUSION 0.15 PER SIDE.

## SOIC-8 EP CASE 751AC ISSUE E

DATE 05 OCT 2022

### NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS
3. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE PROTRUSION SHALL BE 0.004 IN EXCESS OF MAXIMUM MATERIAL CONDITION.
4. DIMENSION D DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS, OR GATE BURRS. MOLD FLASH, PROTRUSIONS, OR GATE BURRS SHALL NOT EXCEED 0.006 PER SIDE. DIMENSION E1 DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION. INTERLEAD FLASH OR PROTRUSION SHALL NOT EXCEED 0.010 mm PER SIDE.
5. THE PACKAGE TOP MAY BE SMALLER THAN THE PACKAGE BOTTOM. DIMENSIONS D AND E1 ARE DETERMINED AT THE OUTERMOST EXTREMES OF THE PLASTIC BODY AT DATUM H.
6. DATUMS A AND B ARE TO BE DETERMINED AT DATUM H.
7. DIMENSIONS b AND c APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10 TO 0.25 FROM THE LEAD TIP.
8. A1 IS DEFINED AS THE VERTICAL DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT ON THE PACKAGE BODY.

DIM	MILLIMETERS		
	MIN.	NOM.	MAX.

### TSSOP-14 EP CASE 948AW ISSUE C

DATE 09 OCT 2012

NOTES:

- DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
- CONTROLLING DIMENSION: MILLIMETERS.
- DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE PROTRUSION SHALL BE 0.07 mm MAX. AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADII OF THE FOOT. MINIMUM SPACE BETWEEN PROTRUSION AND ADJACENT LEAD IS 0.07.
- DIMENSION D DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS OR GATE BURRS. MOLD FLASH, PROTRUSIONS OR GATE BURRS SHALL NOT EXCEED 0.15 mm PER SIDE. DIMENSION D IS DETERMINED AT DATUM H.
- DIMENSION E1 DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSIONS. INTERLEAD FLASH OR PROTRUSIONS SHALL NOT EXCEED 0.25 mm PER SIDE. DIMENSION E1 IS DETERMINED AT DATUM H.
- DATUMS A AND B ARE DETERMINED AT DATUM H.
- A1 IS DEFINED AS THE VERTICAL DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT ON THE PACKAGE BODY.
- SECTION B-B TO BE DETERMINED AT 0.10 TO 0.25 mm FROM THE LEAD TIP.

MILLIMETERS
