Table 1. PIN FUNCTION DESCRIPTION

Pin No. DFN8	Pin Name	Description
7,8	IN	Unregulated input supply.
4, EPAD	GND	Ground.
5	EN	Driving the enable pin (EN) high turns on the regulator. Driving this pin low puts the regulator into shutdown mode.
6	NR	Connect an external capacitor between this pin and ground to reduce the output noise to very low levels. The capacitor slows down the V_{OUT} ramp as well (soft-start). Max recommended C_{NR} value is 0.47 μF
3	FB	This pin is the input to the control loop error amplifier and is used to set the output voltage of the device.
1,2	OUT	Regulator output. A 4.7 μF to 100 μF capacitor is required for stability.

APPLICATIONS INFORMATION

General Information

The NCV59800 regulator is equipped with Noise Reduction pin (NR) for noise sensitive applications. A noise reduction capacitor (C_{NR}) at the NR pin bypasses noise generated by the bandgap reference. This family of regulators offers sub-bandgap output voltages, current limit, and thermal protection, and is fully specified from –40 °C to +125 °C. assuming resistors with zero error. For the actual design, pay attention to any resistor error factors. Figure 3 gives the Typical Application Schematics.

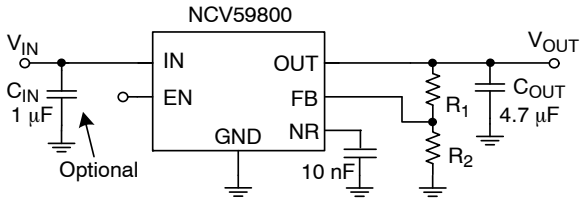

Figure 3. Typical Application Schematics

Output Voltage Setting

The output voltage can be adjusted from 0.8 V to 5.0 V using resistors divider between the output and the FB input. The values of R1 and R2 can be calculated for any voltage using the following formula:

$$V_{OUT} = 0.8\ V \left(1 + \frac{R_1}{R_2}\right)$$

Recommended resistor values for frequently used voltages can be found in the Table 6.

Capacitors Selection

Although an input capacitor is not required for stability, it is good analog design practice to connect a 0.1 μF to 1.0 μF low equivalent series resistance (ESR) capacitor across the input supply near the regulator. The NCV59800 is designed to be stable with standard ceramic output capacitors of capacitance values 4.7 μF up to 100 μF. This device is evaluated using a 4.7 μF/10 V, 10% tolerance, X5R type Ceramic Capacitors of 0805 size.

X5R– and X7R–type capacitors are highly recommended because they have minimal variation in value and ESR over temperature.

Startup Response

The C_{NR} serves not only for noise reduction. During Start-Up the C_{NR} capacitor works like the Soft Start timing capacitor. The controlled monotonic ramping of Voltage Reference (adjustable Soft-Start) is limiting the Inrush Current .

Table 6. RECOMMENDED 1% FEEDBACK RESISTOR VALUES FOR FREQUENTLY USED NOMINAL OUTPUT VOLTAGES

V_{OUT}	R_1	R_2
0.8 V	0 Ω (Short)	10.0 kΩ
1.0 V	2.49 kΩ	10.0 kΩ
1.2 V	4.99 kΩ	10.0 kΩ
1.5 V	8.87 kΩ	10.0 kΩ
1.8 V	12.5 kΩ	10.0 kΩ
2.5 V	21.0 kΩ	10.0 kΩ
3.3 V	30.9 kΩ	10.0 kΩ
5.0 V	52.3 kΩ	10.0 kΩ

Power Dissipation

The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. For reliable operation junction temperature should be limited to +125 °C.
