

Current Controller for Automotive LED Lamps

NCV7691

The NCV7691 is a device which uses an external NPN bipolar device combined with feedback resistor(s) to regulate a current for use in driving LEDs. The target application for this device is automotive rear combination lamps. A single driver gives the user flexibility to add single channels to multichannel systems. A dedicated dimming feature is included via the PWM input pin. The individual driver is turned off when an open load or short circuit is detected.

LED brightness levels are easily programmed using an external resistor in series with the bipolar transistor. The use of the resistor gives the user the flexibility to use the device over a wide range of currents.

Multiple strings of LEDs can be operated with a single NCV7691 device.

Set back power limit reduces the drive current during overvoltage conditions.

The device is available in a SOIC8 package.

Features

- Constant Current Output for LED String Drive
- External Bipolar Device for Wide Current Range Flexibility
 - ♦ With BCP56 Transistor, Can Drive Multiple Strings Concurrently (ref. Datasheet Info)
- External Programming Current Resistor
- Pulse Width Modulation (PWM) Control
- Negative Temperature Coefficient Current Control Option
- Open LED String Diagnostic
- Short-Circuit LED String Diagnostic
- Multiple LED String Control
- Overvoltage Set Back Power Limitation
- SOIC8 Package
- AEC-Q100 Qualified and PPAP Capable
- These are Pb-Free Devices

Applications

- Rear Combination Lamps (RCL)
- Daytime Running Lights (DRL)
- Fog Lights
- Center High Mounted Stop Lamps (CHMSL) Arrays
- Turn Signal and Other Externally Modulated Applications
- General Automotive Linear Current LED Driver

PIN FUNCTION DESCRIPTION

SOIC8 Package		
Pin #	Label	Description
1	VS	Automotive Battery input voltage
2	PWM	Logic input for output on/off control. Pull high for output on.
3	FLTS	A capacitor to ground sets the time for open circuit, short circuit, and overtemperature detection.
4	NTC	Optional input for Negative Temperature Coefficient performance. Ground this pin if Negative Temperature Coefficient is not used.
5	GND	Ground
6	FB	Feedback pin for current regulation
7	BASE	Base Drive for external transistor (16 mA [min])
8	SC	LED Short Circuit Detection Input. Ground pin if not used.

MAXIMUM RATINGS

(Voltages are with respect to GND, unless otherwise specified)

Rating	Value	Unit
Supply Voltage (VS) DC Peak Transient	–0.3 to 50 50	V
High Voltage Pins (PWM, SC)	–0.3 to (VS + 0.3)	V
Low Voltage Pins (FB, NTC)	–0.3 to 3.6	V
Low Voltage Pin (BASE)	–0.3 to 3.6 or VS + 0.6 whichever is lower	V
Fault Input / Output (FLT5)	–0.3 to (VS + 0.3) *Internally limited charge voltage	V
Junction Temperature, T _J	–40 to 150	°C
Peak Reflow Soldering Temperature: Pb-Free, 60 to 150 seconds at 217 °C (Note 1)	260 peak	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- For additional information, please see or download the **onsemi** Soldering and Mounting Techniques Reference Manual, [SOLDDRRM/D](#) and Application Note [AND8003/D](#).

Detailed Operating Description

The NCV7691 device provides low-side current drive via an external bipolar transistor. The low voltage (152 mV) current sense threshold allows for maximum dropout voltage in the system. Dimming is performed using the dedicated PWM pin on the IC. Average output current is directly related to the intensity of the LED (or LED string).

Output Drive

Figure 7 shows the typical output drive configuration. A feedback loop regulates the current through the external LED. U1 monitors the voltage across the external sense resistor (R1). When the voltage exceeds the 152 mV reference, the output of U1 goes from high to low sending

a signal the buffer (U2) decreasing the base drive to the external transistor (BCP56). For loads above 150 mA, a PZT651 device (replacing the BCP56) is recommended for stable operation.

Normal operation includes a substantial voltage drop across the three LEDs limiting the power dissipation across the BCP56 transistor. Care must be taken when reducing the number of LEDs in the LED string for power considerations in the BCP56 and the Under Voltage Lockout performance. While the built in threshold for Under Voltage Lockout is specified at 4.0 V, another threshold is present at lower voltages (2.6 V) which could impact illuminations with the use of lower threshold voltage LEDs or lower string count.

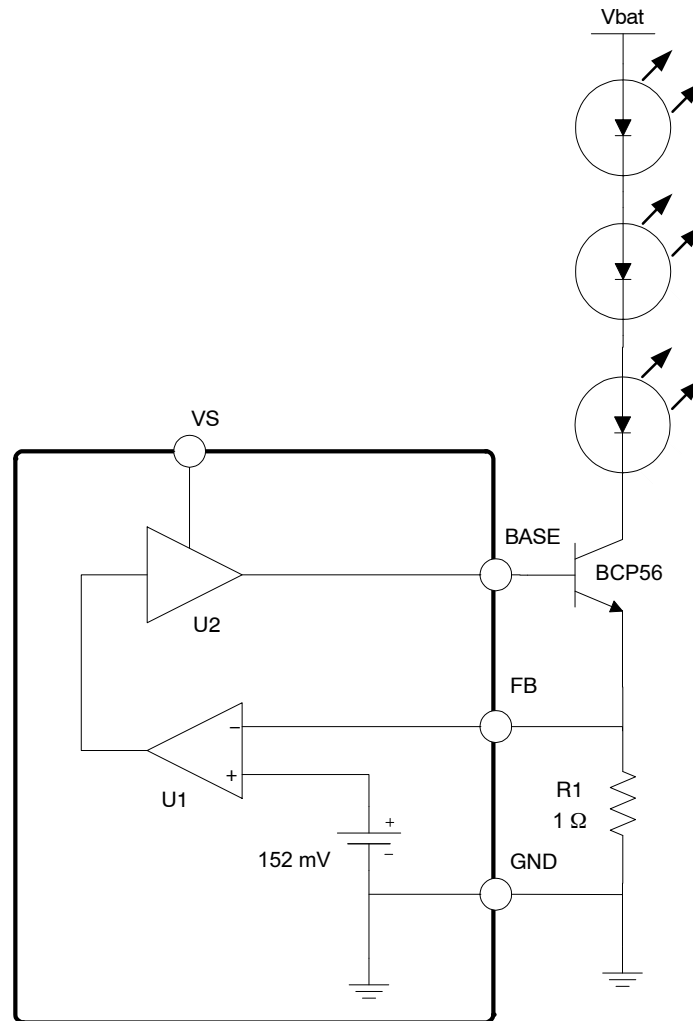

Figure 7. Output Drive Configuration

FLTS Reporting

FLTS reports three fault conditions (by going high) all of which force the output off.

- Open Circuit (latched)
- Thermal Shutdown (thermal hysteresis)
- Short Circuit (latched)

Latched off conditions can be reinitiated by a toggle of the PWM pin or a power down of the supply (VS).

Open Load Detection

Faulted output strings due to open load conditions sometimes require the complete shutdown of illumination within an automotive rear lighting system. The NCV7691 provides that feature option.

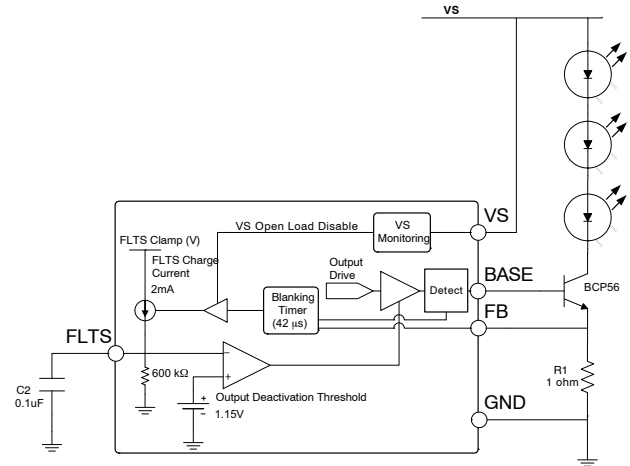

There are two open load detections schemes in the NCV7691. These are OR'd conditions.

1. In normal regulation, the IC monitors the FB voltage (typ 152 mV). When this voltage falls by 50% (to typ 76 mV), an open circuit is detected and a current starts to charge FLTS to flag open load, once FLTS voltage crosses the output deactivation threshold the driver is switched off resulting in a latched off-state. When regulating via the NTC pin, the open load detection threshold is $V(NTC)/20$.
2. During open load, the base current increases to try and satisfy the regulation loop. Internal circuitry monitors the base current. When the Base Current Drive reaches the Output Source Current (typ 25 mA) threshold, an open circuit is flagged and the driver is latched off.

Two schemes are used should the rise in base current create a regulated voltage on the feedback pin (FB). If this occurs scheme #1 would not detect the open load.

When an open load is detected, the output turns off, and can be turned back on again by a toggle of the PWM pin or a power down of the supply (VS).

If the open load feature is not used, FLTS should be tied to GND. Grounding FLTS disables open load detection. Short circuit detection and thermal shutdown functions remain active but are not reported externally. The BASE pin is actively held low in this case.

Open load can be disabled by connecting FLTS to GND.

Figure 8. Open Load Detection Circuitry

Table 1. OPEN LOAD DETECTION

Open Load (VS > Open Load Disable Threshold)	FLTS	BASE
No Open Load	(with FLTS capacitor) Normal Operation (held low)	regulation
No Open Load	Grounded	regulation
FB = 1/2 regulation	(with FLTS capacitor) FLTS starts charging	Held low via internal pull-down resistor after time-out.
BASE Current > 25 mA [typ]	(with FLTS capacitor) FLTS starts charging	Held low via internal pull-down resistor after time-out.
FB = 1/2 regulation	Grounded	Actively held low.
BASE Current > 25 mA [typ]	Grounded	Actively held low.

Multiple String Open Load Consideration

In multi-string applications with high-beta transistors, the feedback voltage from individual strings is averaged, so one defective LED string does not always lead to the open load detection.

One of the ways to improve the open load detection capability is more precise external BASE current limitation. An example of the circuit with one extra resistor and PNP bipolar is shown in Figure 9.

Low voltage system operation is typically limited by head room in the LED string. Because of this limitation, detection of open loads is inactive below $V_S = \text{typ } 8.5 \text{ V}$ (Open Load Disable voltage). There is also an upper limitation. The current roll off feature of the part resets the loop at a lower reference voltage and consequential lower current for V_S above the Overvoltage Fold-back threshold on V_S , (typ 19.5 V). The open load Detection circuitry is inactive for V_S above this Overvoltage Fold-back threshold voltage.

The timing for open load detection is programmed using the FLTS pin. The NCV7691 device regulates a 152 mV reference point (Figure 8 on the feedback pin (FB)). When the voltage decreases (half of the FB Regulation Voltage) or the base current reaches the internal 25 mA (typ) limit for 42 μ s the timer associated with the FLTS pin starts by charging the capacitor with a 2 mA current source. When the voltage on FLTS exceeds the output Deactivation Threshold (1.15 V (typ)), the BASE pin is pulled low and is held low by an internal pulldown resistor.

Figure 10 shows an open-drain logic level FET serving as a buffer to the microprocessor.

The schematic diagram illustrates the FLTS clamp circuit. It features a BSS138 MOSFET with its source connected to ground and its drain connected to the FLTS node. The FLTS node is also connected to a 600k pull-down resistor and a 0.1uF capacitor. The gate of the MOSFET is connected to the output of an op-amp configured as a voltage follower. The non-inverting input of the op-amp is connected to the FLTS node and a 1.15V reference. The op-amp's output drives the gate of the MOSFET. The FLTS node is also connected to a 2mA current source and a 600k pull-down resistor. The FLTS node is connected to a microprocessor.

The schematic diagram illustrates the NCV7691 application. It features a microprocessor connected to the FLTS pin of the NCV7691. A BSS138 transistor is used as a switch, with its gate connected to the FLTS pin and its drain connected to the FLTS clamp. The FLTS charge current is specified as 2mA. A 600k FLTS pull-down resistor is connected to the FLTS pin. The output deactivation threshold is set to 1.15V. A capacitor C1 (0.1uF) is connected to the FLTS pin to ground.

Figure 11. FLTS Wired OR to Microprocessor

Temperature Compensation

The NCV7691 device typically operates with a zero TC output current source. The NTC (Negative Temperature Coefficient) pin provides an alternative for an output current which degrades with temperature as defined by the designer's external components.

Zero TC operation is provided when the NTC pin is connected to GND. When a negative temperature coefficient output current is desired to compensate for effects of external LED illumination, the setup shown in Figure 12 will provide the function. On the NTC pin, a comparator detects when the voltage is higher than typ 220 mV, and this voltage is used to provide the feedback reference voltage for the current feedback regulation loop.

The zener provides a reference voltage for the negative temperature coefficient NTC device through an external divider. Be careful of your choice of the zener diode as the temperature coefficients of the devices have a wide variation with the low voltage zeners having a high negative temperature coefficient and the high voltage zeners having

a positive temperature coefficient. The regulation loop voltage on NTC should be sufficiently higher than the 220 mV reference voltage to avoid interactions. A typical regulation voltage of 1.6 V is suggested.

The overall tolerance specification for the NTC functionality is broken down into two components.

1. Absolute error. A $\pm 2\%$ tolerance is attributed to the expected value as a result of internal circuitry (most predominantly the 1/10 resistor divider).
2. Reference error. A $\pm 7\text{mV}$ offset mismatch in the circuitry referenced to FB.

This provides a part capability of $(V(NTC)/10) \times 0.98 - 7mV < V(FB) < (V(NTC)/10) \times 1.02 + 7mV$.

In addition to the temperature coefficient of the Zener diode (D1), a PTC resistor (R2) can be used to enhance the effect of the overall negative temperature coefficient. A positive temperature coefficient resistor at the top of the resistor divider creates a negative temperature coefficient at the resistor divider output. Alternatively, a negative temperature coefficient resistor for R3 would have the same effect.

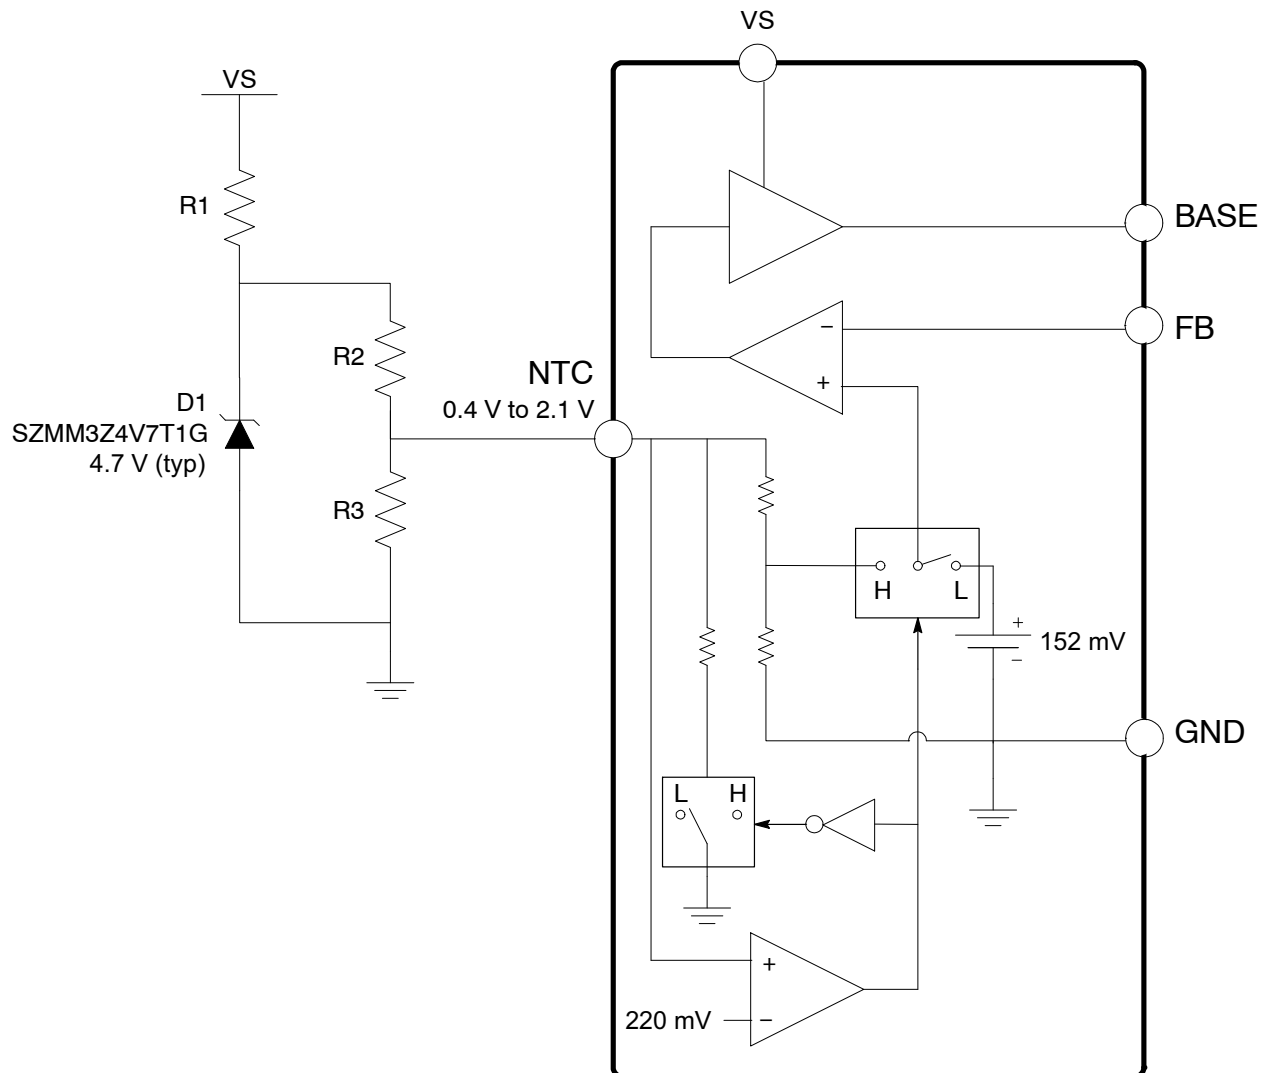

Figure 12. Negative Temperature Compensation Operation

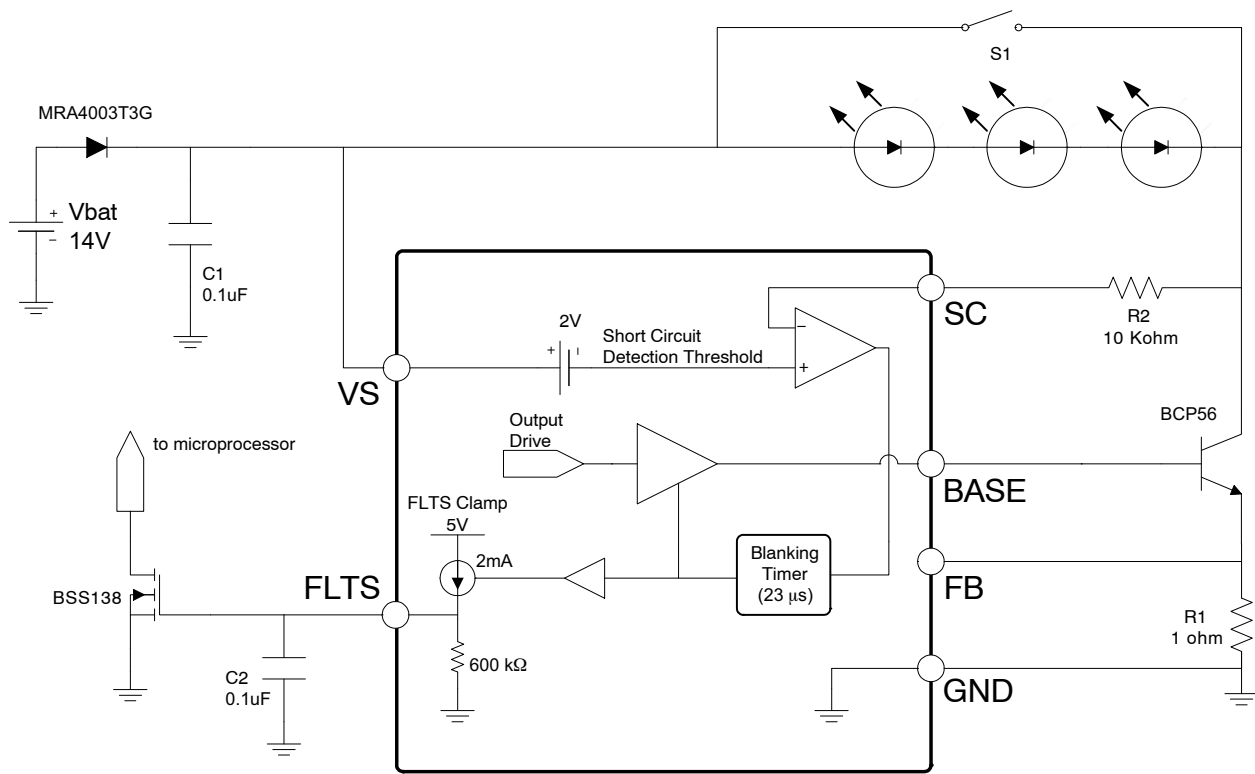

Short Circuit Detection

The short circuit (SC) pin of the device is used as an input to detect a fault when the collector of the external bipolar transistor is shorted to the battery voltage. The threshold voltage detection is referenced 2.0 volts down from the VS pin. A voltage of less than 2.0 volts between VS and SC will latch the device off. The PWM pin must be toggled or UVLO event must occur to reinitiate a turn-on. The detection time for this event is swift to protect the external transistor. To maintain operation during transient events down to 4.5 V, the short circuit detection circuitry is inactive below VS = typ 8.5 V. (the same Open Load Disable voltage as used to disable Open load detection). Otherwise false short circuit events could be falsely triggered due to non-conduction of the external LEDs during transients. Figure 13 shows a short circuit event modeled as a switch

(S1). The comparator connected between VS and SC is referenced to a voltage 2.0 V down from VS. A detection voltage less than 2.0 V will toggle a signal from the comparator to the output drive buffer turning off output drive (BASE) to the external bipolar transistor. An initial blanking time of 23 μ s is used during turn-on of the device to ignore false detections. This is beneficial during normal operation and when the device is used without a microprocessor input (PWM) interface as in Figure 13.

Switching off the Base-driver in case of SC, will also make the FLTS charge active, indicating the error to the microprocessor.

When having multiple channels an isolation might be needed to provide the appropriate voltage back to the SC pin during short circuit. Figure 14 shows how external diodes can provide this feature.

Short Circuit Detection is disabled below 8.5 V (typ).

Figure 13. Short Circuit Detection

Short Circuit Detection with 4 or more Channels

Interfacing the short circuit detection for multiple channels with one NCV7691 driver system is done easily using diodes or a diode resistor combination depending on your system requirements.

Figure 14 shows the implementation using 4 individual diodes which will work for all applications.

Figure 15 shows an implementation which will work provided the drop across the loads is < 3.4 V. This limitation is due to the SC minimum specification of $V_S - 1.7$ V. This setup saves the user 2 diodes.

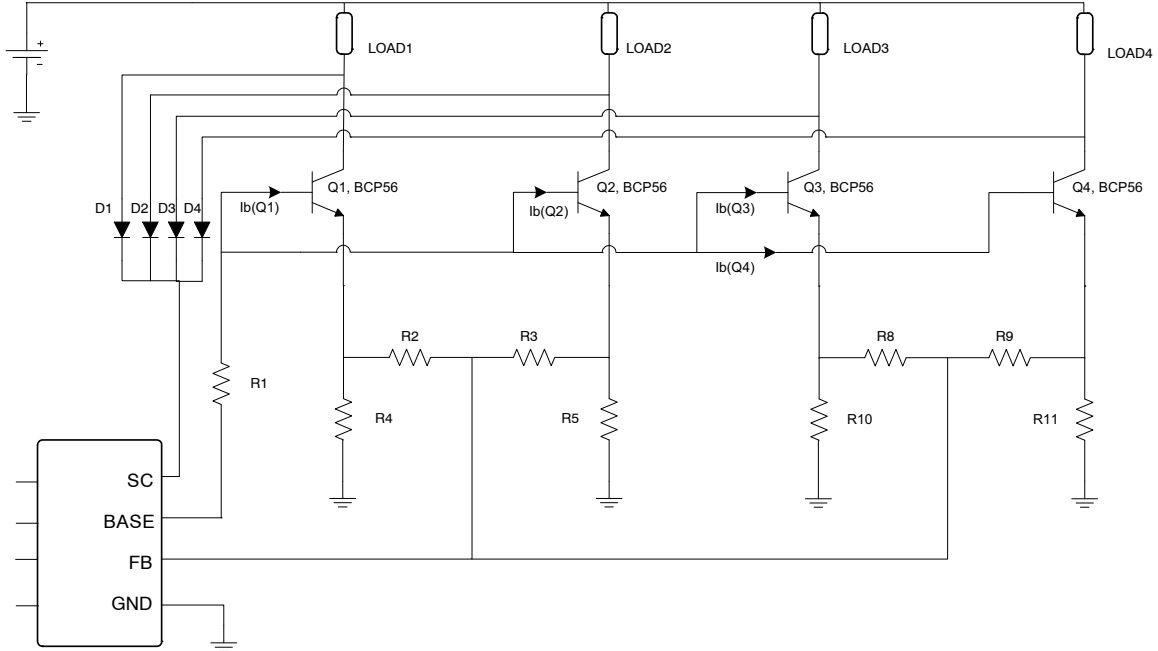

Figure 14. Short Circuit Detection with 4 or more Channels

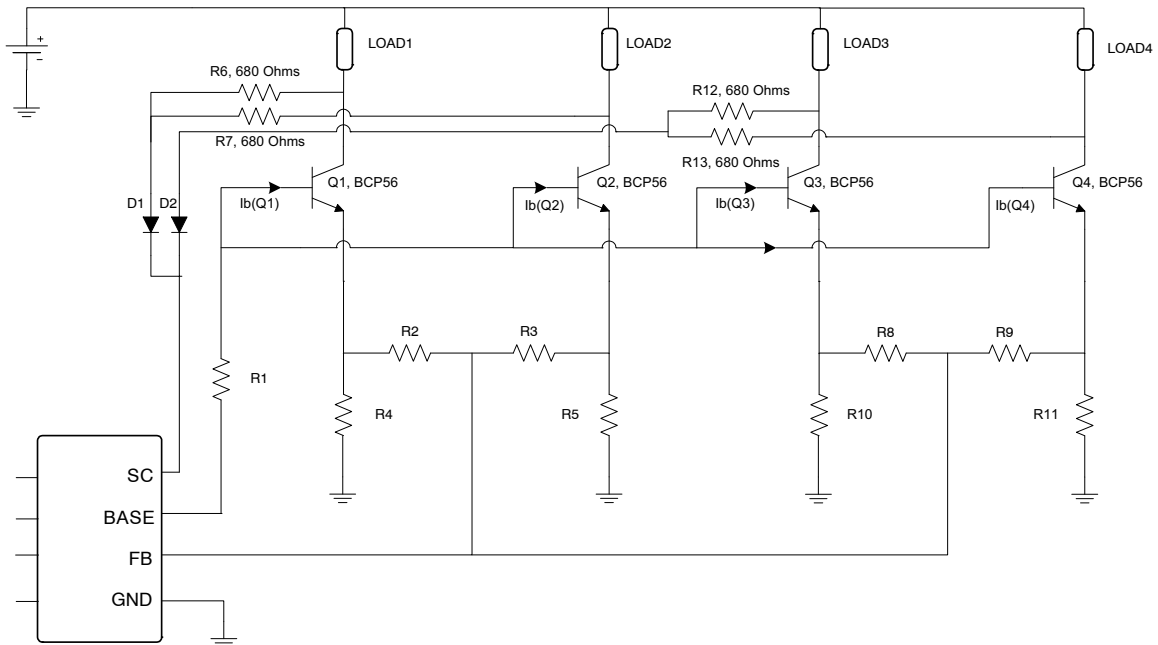

Figure 15. Saving Two Diodes for Short Circuit Protection

Thermal ShutDown

The thermal shut down circuit checks the internal junction temperature of the device. When the internal temperature rises above the Thermal shutdown threshold for greater than the thermal shutdown filter time (23 μ s [typ]) the device is switched off. The filter is implemented to achieve a clean detection.

Switching off the Base-driver in case of TSD, will also make the FLTS charge active, indicating the error to the microprocessor.

Applications

Direct Drive without direct battery connection:

Some applications may not allow for a direct connection of VS to the battery voltage. These applications require a connection with a smart-FET. Figure 16 highlights this setup.

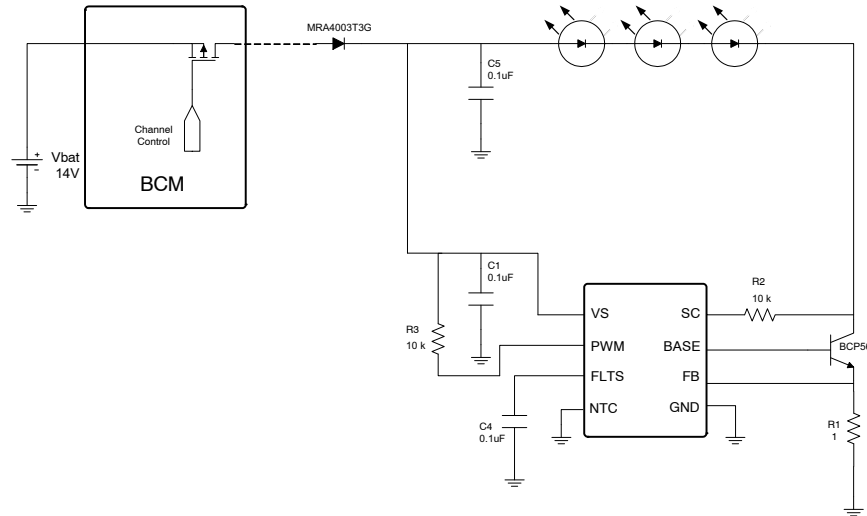

Figure 16. SmartFET Control

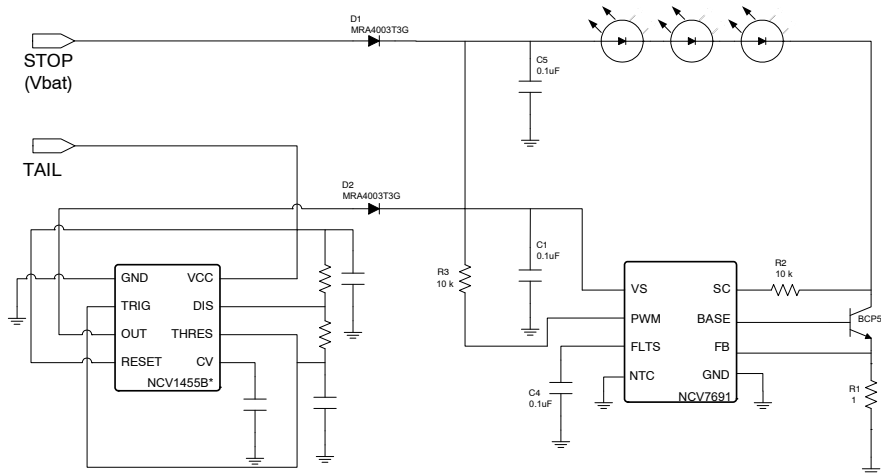

Figure 17. Stoplight / Taillight Application

Stoplight / Tail Light Application

Automotive applications have a need to drive the RCL (Rear Combination Light). Combining the NCV7691 with the NCV1455B device accomplishes that task. Figure 17 shows the interface of the two ICs using an additional diode (D2). The STOP input signal provides a signal to the NCV7691 which will provide a 100% duty cycle output to the LED strings whenever STOP is high. When only TAIL is high, a modulated duty cycle input is provided to the PWM input and also provides power to the NCV7691 and the LED string. The NCV1455B can provide up to 200 mA (albeit with a 2.5 V drop at 200 mA) of output drive current.

If your application exceeds the current capability of the NCV1455B (200mA) two extra diodes will be required as shown in Figure 18. In this case, the current flow through the LEDs will come from STOP and/or TAIL eliminating the high current from the NCV1455B.

NCV7691

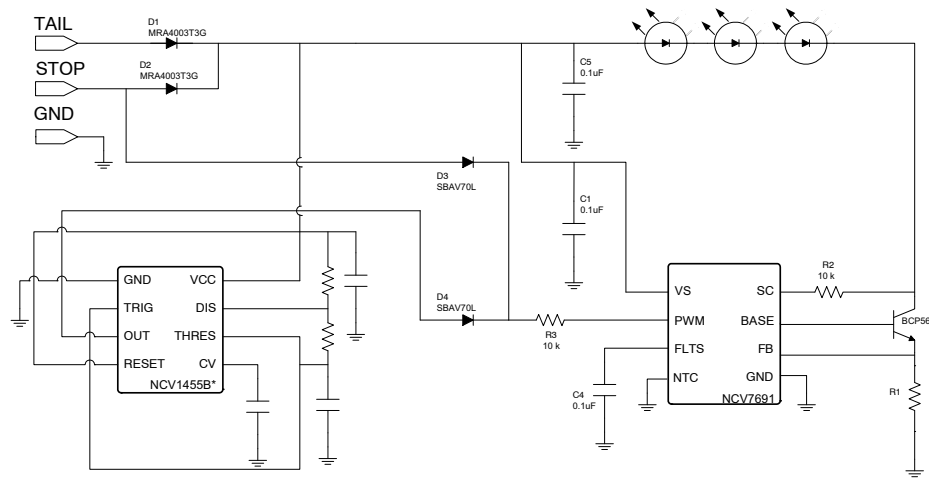

Figure 18. Stoplight / Taillight Application at higher currents

Figure 19: Application Diagram with no microprocessor. A resistor pull-up from PWM to VS illustrates how the device can be used as a standalone LED driver without using a microprocessor to drive the PWM input.

Figure 20 along with Figure 21 and Figure 22 highlight the use of the NCV7691 device with multiple strings connected to a common drive BASE pin and using external resistors to tie additional strings to a common feedback point (FB). The FB pin will maintain regulation with the FB pin at 152 mV.

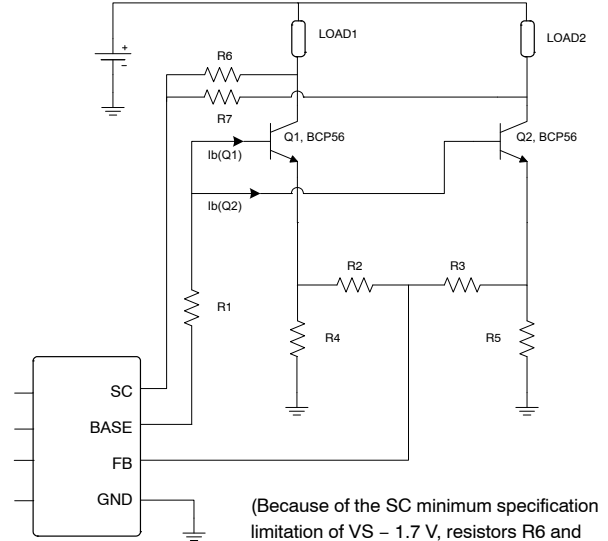

Figure 19. Application Diagram with No Microprocessor

R1 is used to limit current in the event of an open circuit on one of the strings.

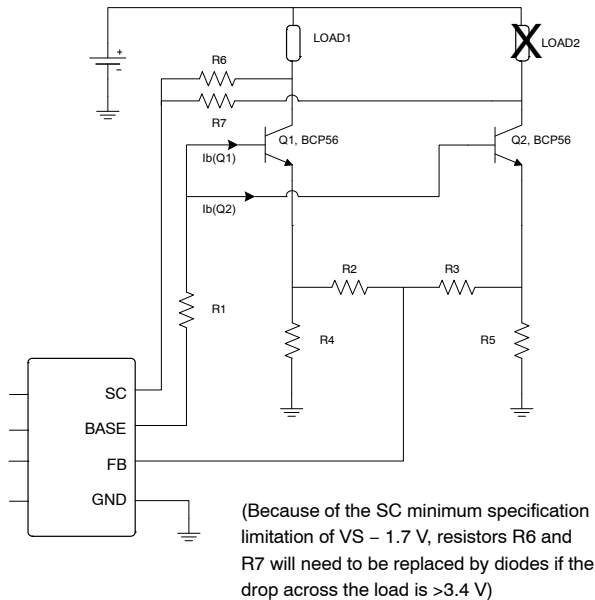

Figure 21: Open Circuit.

It shows the change in BASE drive which occurs with an open circuit in one of the strings. The drive current out of BASE changes from $(I_b(Q1) + I_b(Q2))$ to $(I_b(Q1) + I_c(Q2))$ as regulation will try to maintain in the loop to get 152 mV on FB. Figure 22 shows the equivalent circuit when an open load occurs.

(Because of the SC minimum specification limitation of VS – 1.7 V, resistors R6 and R7 will need to be replaced by diodes if the drop across the load is >3.4 V)

Figure 20. Driving Multiple Strings

(Because of the SC minimum specification limitation of VS – 1.7 V, resistors R6 and R7 will need to be replaced by diodes if the drop across the load is >3.4 V)

onsemi and **onsemi** are trademarks of Semiconductor Components Industries, LLC dba **onsemi** or its subsidiaries in the United States and/or other countries. **onsemi** reserves the right to make changes without further notice to any products herein. **onsemi** makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. **onsemi** does not convey any license under its patent rights nor the rights of others.

onsemi, **Onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. **onsemi** reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and **onsemi** makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
