General Description

NFA32512L72 is an advanced IPM module providing a fully−featured, high−performance inverter output stage for AC Induction, BLDC and PMSM motors. These modules integrate optimized gate drive of the built−in IGBTs to minimize EMI and losses, while also providing multiple on−module protection features including under−voltage lockouts, over−current shutdown, thermal monitoring of drive IC, and fault reporting. The built−in, high−speed HVIC requires only a single supply voltage and translates the incoming logic−level gate inputs to the high−voltage, high−current drive signals required to properly drive the module's internal IGBTs. Separate negative IGBT terminals are available for each phase to support the widest variety of control algorithms.

Features

- 1200 V/25 A 3−phase FS7 IGBT Inverter with Integral Gate Drivers and Protections
- Built−in Under−Voltage Protection (UVP)
- Separated Open−Emitter Pins from Low−Side IGBTs for Three−Phase Current Sensing
- LVIC Temperature−Sensing Built−In for Temperature Monitoring
- Isolation Rating: 2500 Vrms / 1 min.
- This Device is Pb−Free and is RoHS Compliant

Typical Applications

- Industrial Drives
- Industrial Pumps
- Industrial Fans
- Industrial Automation

Integrated Power Functions

- 1200 V − 25 A IGBT inverter for three−phase DC / AC power conversion (Please refer to Figure 1)

Integrated Drive, Protection and System Control Functions

- For Inverter High−side IGBTs: gate drive circuit, high−voltage isolated high−speed level shifting control circuit Under−Voltage Lock−Out Protection (UVLO)
- For Inverter Low−side IGBTs: gate drive circuit, Over Current Protection (OCP) control supply circuit Under−Voltage Lock−Out Protection (UVLO)
- Fault Signaling: corresponding to UVLO (low−side supply) and over current faults
- Input Interface: active−HIGH interface, works with 3.3 / 5 V logic, Schmitt−trigger input

NOTES:
1. Inverter low−side is composed of three IGBTs, freewheeling diodes for each IGBT, and one control IC. It has gate drive and protection functions.
2. Inverter power side is composed of four inverter DC−link input terminals and three inverter output terminals.
3. Inverter high−side is composed of three IGBTs, freewheeling diodes, and three drive ICs for each IGBT.

ABSOLUTE MAXIMUM RATINGS (Tj = 25°C unless otherwise specified)

TYPICAL APPLICATION CIRCUIT

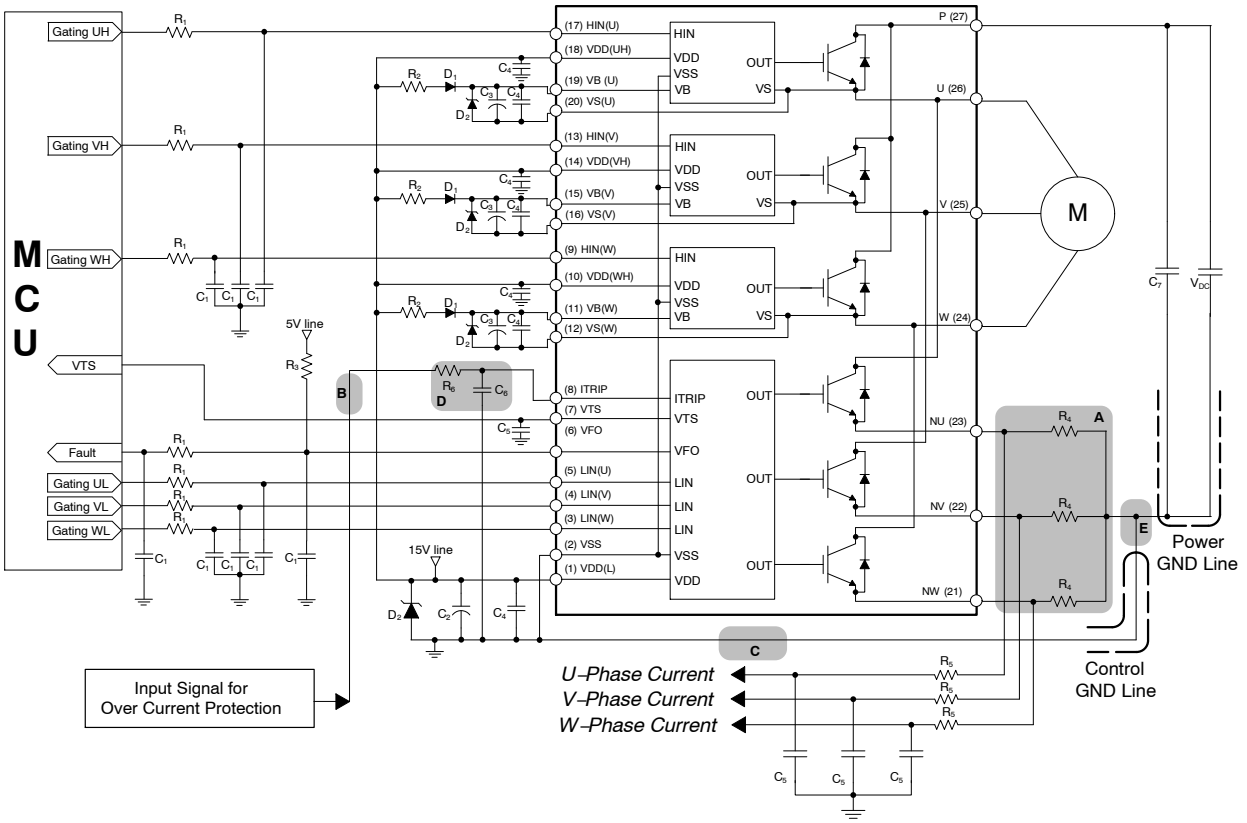

Figure 10. Typical Application Circuit

NOTES:

11. To avoid malfunction, the wiring of each input should be as short as possible. (less than 2 – 3 cm)
12. V_{FO} output is open−drain type. This signal line should be pulled up to the positive side of the MCU or control power supply with a resistor that makes I_{FO} up to 2 mA.
13. Input signal is active−HIGH type. There is a 5 kΩ resistor inside the IC to pull−down each input signal line to GND. RC coupling circuits should be adopted for the prevention of input signal oscillation. R_1C_1 time constant should be selected in the range 50 ~ 150 ns. (Recommended R1 = 100 Ω, C_1 = 1 nF)
14. Each wiring pattern inductance of A point should be minimized (Recommend less than 10 nH). Use the shunt resistor R_4 of surface mounted (SMD) type to reduce wiring inductance. To prevent malfunction, wiring of point E should be connected to the terminal of the shunt resistor R_4 as close as possible.
15. To prevent errors of the protection function, the wiring of B, C, and D point should be as short as possible.
16. In the over current protection circuit, please select the R_6C_6 time constant in the range 1.5 ~ 2 μs. Do enough evaluation on the real system because over current protection time may vary wiring pattern layout and value of the R_6C_6 time constant.
17. Each capacitor should be mounted as close to the pins of the product as possible.
18. To prevent surge destruction, the wiring between the snubber capacitor C_7 and the P & GND pins should be as short as possible. The use of a high−frequency non−inductive capacitor of around 0.1 ~ 0.22 μF between the P & GND pins is recommended.
19. Relays are used at almost every systems of electrical equipment at industrial application. In these cases, there should be sufficient distance between the CPU and the relays.
20. The zener diode or transient voltage suppressor should be adopted for the protection of ICs from the surge destruction between each pair of control supply terminals (Recommended zener diode is 22 V / 1 W, which has the lower zener impedance characteristic than about 15 Ω).
21. C_2 of around 7 times larger than bootstrap capacitor C_3 is recommended.
22. Please choose the electrolytic capacitor with good temperature characteristic in C_3. Also, choose 0.1 ~ 0.2 μF R−category ceramic capacitors with good temperature and frequency characteristics in C_4.
