

100 mA, Low Power Low Dropout Voltage Regulator

SCV2951

SOIC-8
CASE 751

The SCV2951 is a micropower voltage regulator that is specifically designed to maintain proper regulation with an extremely low input-to-output voltage differential. This device features a very low quiescent bias current of 75 μ A and is capable of supplying output currents in excess of 100 mA. Internal current and thermal limiting protection is provided.

The SCV2951 has three additional features. The first is the $\overline{\text{Error}}$ Output that can be used to signal external circuitry of an out of regulation condition, or as a microprocessor power-on reset. The second feature allows the output voltage to be preset to 5.0 V, 3.3 V or 3.0 V output (depending on the version) or programmed from 1.25 V to 29 V. It consists of a pinned out resistor divider with direct access to the Error Amplifier feedback input. The third feature is a Shutdown input that allows a logic level signal to turn-off or turn-on the regulator output.

Due to the low input-to-output voltage differential and bias current specifications, these devices are ideally suited for battery powered computer, consumer, and industrial equipment where an extension of useful battery life is desirable. The SCV2951 is available in the eight pin SOIC-8 package. The device features an initial output voltage tolerance $\pm 0.5\%$.

Features

- Low Quiescent Bias Current of 75 μ A
- Low Input-to-Output Voltage Differential of 50 mV at 100 μ A and 380 mV at 100 mA
- 5.0 V, 3.3 V or 3.0 V $\pm 0.5\%$ Allows Use as a Regulator or Reference
- Extremely Tight Line and Load Regulation
- Requires Only a 1.0 μ F Output Capacitor for Stability
- Internal Current and Thermal Limiting
- Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable; Device Temperature Grade 0: -40°C to $+150^\circ\text{C}$ Ambient Operating Temperature Range
- These Devices are Pb-Free and RoHS Compliant
- $\overline{\text{Error}}$ Output Signals an Out of Regulation Condition
- Output Programmable from 1.25 V to 29 V
- Logic Level Shutdown Input

Figure 1. Representative Block Diagrams

MAXIMUM RATINGS (T_A = 25 °C, unless otherwise noted.)

Rating	Symbol	Value	Unit
Input Voltage	V _{CC}	30	Vdc
Peak Transient Input Voltage (t < 300 ms)	V _{CC}	32	Vdc
Power Dissipation and Thermal Characteristics			
Maximum Power Dissipation	P _D	Internally Limited	W
Thermal Resistance, Junction-to-Ambient	R _{θJA}	180	°C/W
Thermal Resistance, Junction-to-Case	R _{θJC}	45	°C/W
Feedback Input Voltage	V _{fb}	-1.5 to +30	Vdc
Shutdown Input Voltage	V _{sd}	-0.3 to +30	Vdc
Error Comparator Output Voltage	V _{err}	-0.3 to +30	Vdc
Operating Ambient Temperature Range	T _A	-40 to +150	°C
Maximum Die Junction Temperature Range	T _J	+150	°C
Storage Temperature Range	T _{stg}	-65 to +150	°C
ESD Capability, Human Body Model (Note 1)	ESD _{HBM}	2000	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- This device series incorporates ESD protection and is tested by the following methods:
ESD Human Body Model tested per AEC-Q100-002
- Latch-up Current Maximum Rating tested per AEC-Q100-004 standard:
 - Inputs Low: passing positive current 100 mA and negative current -100 mA
 - Inputs High: passing positive current 100 mA and negative current -10 mA.

Regulator Output Current in Shutdown Mode ($V_{in} = 30\text{ V}$, $V_{shdn} = 2.0\text{ V}$, $V_O = 0$, Pin 6 Connected to Pin 7)	I_{off}	–	3.0	10	μA

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

3. Low duty pulse techniques are used during test to maintain junction temperature as close to ambient as possible.

4. Noise tests on the SCV2951 are made with a 0.01 μF capacitor connected across Pins 7 and 1.

DEFINITIONS

Dropout Voltage – The input/output voltage differential at which the regulator output no longer maintains regulation against further reductions in input voltage. Measured when the output drops 100 mV below its nominal value (which is measured at 1.0 V differential), dropout voltage is affected by junction temperature, load current and minimum input supply requirements.

Line Regulation – The change in output voltage for a change in input voltage. The measurement is made under conditions of low dissipation or by using pulse techniques such that average chip temperature is not significantly affected.

Load Regulation – The change in output voltage for a change in load current at constant chip temperature.

Maximum Power Dissipation – The maximum total device dissipation for which the regulator will operate within specifications.

Bias Current – Current which is used to operate the regulator chip and is not delivered to the load.

Output Noise Voltage – The RMS ac voltage at the output, with constant load and no input ripple, measured over a specified frequency range.

Leakage Current – Current drawn through a bipolar transistor collector-base junction, under a specified collector voltage, when the transistor is “off”.

Upper Threshold Voltage – Voltage applied to the comparator input terminal, below the reference voltage which is applied to the other comparator input terminal, which causes the comparator output to change state from a logic “0” to “1”.

Lower Threshold Voltage – Voltage applied to the comparator input terminal, below the reference voltage which is applied to the other comparator input terminal, which causes the comparator output to change state from a logic “1” to “0”.

Hysteresis – The difference between Lower Threshold voltage and Upper Threshold voltage.

APPLICATIONS INFORMATION

Introduction

The SCV2951 regulator is designed with internal current limiting and thermal shutdown making them user-friendly. Typical application circuits for the SCV2951 are shown in Figures 20 through 28.

This regulator is not internally compensated and thus require a 1.0 μF (or greater) capacitance between the SCV2951 output terminal and ground for stability. Most types of aluminum, tantalum or multilayer ceramic will perform adequately. Solid tantalums or appropriate multilayer ceramic capacitors are recommended for operation below 25 °C.

At lower values of output current, less output capacitance is required for output stability. The capacitor can be reduced to 0.33 μF for currents less than 10 mA, or 0.1 μF for currents below 1.0 mA. Using the 8 pin versions at voltages less than 5.0 V operates the error amplifier at lower values of gain, so that more output capacitance is needed for stability. For the worst case operating condition of a 100 mA load at 1.23 V output (output Pin 1 connected to the feedback Pin 7) a minimum capacitance of 3.3 μF is recommended.

When setting the output voltage of the SCV2951 with external resistors, the resistance values should be chosen to draw a minimum of 1.0 μA .

A bypass capacitor is recommended across the SCV2951 input to ground if more than 4 inches of wire connects the input to either a battery or power supply filter capacitor.

Input capacitance at the SCV2951 Feedback Pin 7 can create a pole, causing instability if high value external resistors are used to set the output voltage. Adding a 100 pF capacitor between the Output Pin 1 and the Feedback Pin 7 and increasing the output filter capacitor to at least 3.3 μF will stabilize the feedback loop.

Error Detection Comparator

The comparator switches to a positive logic low whenever the SCV2951 output voltage falls more than approximately 5.0% out of regulation. This value is the comparator's designed-in offset voltage of 60 mV divided by the 1.235 V internal reference. As shown in the representative block diagram. This trip level remains 5.0% below normal regardless of the value of regulated output voltage. For example, the error flag trip level is 4.75 V for a normal 5.0 V regulated output, or 9.50 V for a 10 V output voltage.

Figure 2 is a timing diagram which shows the $\overline{\text{ERROR}}$ signal and the regulated output voltage as the input voltage to the SCV2951 is ramped up and down. The $\overline{\text{ERROR}}$ signal

becomes valid (low) at about 1.3 V input. It goes high when the input reaches about 5.0 V (V_{out} exceeds about 4.75 V). Since the SCV2951's dropout voltage is dependent upon the load current (refer to the curve in the Typical Performance Characteristics), the input voltage trip point will vary with load current. The output voltage trip point does not vary with load.

The error comparator output is an open collector which requires an external pullup resistor. This resistor may be returned to the output or some other voltage within the system. The resistance value should be chosen to be consistent with the 400 μA sink capability of the error comparator. A value between 100 k Ω and 1.0 M Ω is suggested. No pullup resistance is required if this output is unused.

When operated in the power down mode ($V_{\text{in}} = 0 \text{ V}$), the error comparator output will go high if it has been pulled up to an external supply (the output transistor is in high impedance state). To avoid this invalid response, the error comparator output should be pulled up to V_{out} (see Figure 18).

Figure 18. $\overline{\text{ERROR}}$ Output Timing

Programming the Output Voltage

The SCV2951 may be pin-strapped for the nominal fixed output voltage using its internal voltage divider by tying Pin 1 (output) to Pin 2 (sense) and Pin 7 (feedback) to Pin 6 (5.0 V tap). Alternatively, it may be programmed for any output voltage between its 1.235 reference voltage and its 30 V maximum rating. An external pair of resistors is required, as shown in Figure 19.

Figure 19. Adjustable Regulator

The complete equation for the output voltage is:

$$V_{out} = V_{ref} (1 + R1/R2) + I_{FB} R1$$

where V_{ref} is the nominal 1.235 V reference voltage and I_{FB} is the feedback pin bias current, nominally -20 nA. The minimum recommended load current of 1.0 μ A forces an upper limit of 1.2 M Ω on the value of $R2$, if the regulator must work with no load. I_{FB} will produce a 2% typical error in V_{out} which may be eliminated at room temperature by adjusting $R1$. For better accuracy, choosing $R2 = 100$ k reduces this error to 0.17% while increasing the resistor program current to 12 μ A. Since the SCV2951 typically draws 75 μ A at no load with Pin 2 open circuited, the extra 12 μ A of current drawn is often a worthwhile tradeoff for eliminating the need to set output voltage in test.

Output Noise

In many applications it is desirable to reduce the noise present at the output. Reducing the regulator bandwidth by increasing the size of the output capacitor is the only method

for reducing noise on the 3 lead LP2950. However, increasing the capacitor from 1.0 μ F to 220 μ F only decreases the noise from 430 μ V to 160 μ Vrms for a 100 kHz bandwidth at the 5.0 V output.

Noise can be reduced fourfold by a bypass capacitor across $R1$, since it reduces the high frequency gain from 4 to unity. Pick

$$C_{Bypass} \approx \frac{1}{2\pi R1 \times 200 \text{ Hz}}$$

or about 0.01 μ F. When doing this, the output capacitor must be increased to 3.3 μ F to maintain stability. These changes reduce the output noise from 430 μ V to 126 μ Vrms for a 100 kHz bandwidth at 5.0 V output. With bypass capacitor added, noise no longer scales with output voltage so that improvements are more dramatic at higher output voltages.

Figure 20. 1.0 A Regulator with 1.2 V Dropout

TYPICAL APPLICATIONS

Figure 21. Lithium Ion Battery Cell Charger

Figure 22. Low Drift Current Sink

Error flag occurs when V_{in} is too low to maintain V_{out} , or if V_{out} is reduced by excessive load current.

Figure 23. Latch Off When Error Flag Occurs

Figure 24. 5.0 V Regulator with 2.5 V Sleep Function

All diodes are 1N4148.

Early Warning flag on low input voltage.

Main output latches off at lower input voltages.

Battery backup on auxiliary output.

Operation: Regulator #1's V_{out} is programmed one diode drop above 5.0 V. Its error flag becomes active when $V_{in} \leq 5.7$ V. When V_{in} drops below 5.3 V, the error flag of regulator #2 becomes active and via Q1 latches the main output "off". When V_{in} again exceeds 5.7 V, regulator #1 is back in regulation and the early warning signal rises, unlatching regulator #2 via D3.

Figure 25. Regulator with Early Warning and Auxiliary Output

$$V_{out} = 1.25V (1.0 + R1/R2)$$

For 5.0 V output, use internal resistors. Wire Pin 6 to 7, and wire Pin 2 to $+V_{out}$ Bus.

onsemi and **onsemi** are trademarks of Semiconductor Components Industries, LLC dba **onsemi** or its subsidiaries in the United States and/or other countries. **onsemi** reserves the right to make changes without further notice to any products herein. **onsemi** makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. **onsemi** does not convey any license under its patent rights nor the rights of others.

onsemi, **Onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. **onsemi** reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and **onsemi** makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
