

Silicon Carbide (SiC) Cascode JFET – EliteSiC, Power N-Channel, H-PDSO-F8, 750 V, 18 mohm UJ4SC075018L8S

Description

The UJ4SC075018L8S is a 750 V, 18 mΩ G4 SiC FET. It is based on a unique ‘cascode’ circuit configuration, in which a normally-on SiC JFET is co-packaged with a Si MOSFET to produce a normally-off SiC FET device. The device’s standard gate-drive characteristics allows use of off-the-shelf gate drivers hence requiring minimal re-design when replacing Si IGBTs, Si superjunction devices or SiC MOSFETs. Available in the space-saving H-PDSO-F8 package which enables automated assembly, this device exhibits ultra-low gate charge and exceptional reverse recovery characteristics, making it ideal for switching inductive loads and any application requiring standard gate drive.

Features

- On-Resistance $R_{DS(on)}$: 18 mΩ (typ)
- Operating Temperature: 175 °C (Max)
- Excellent Reverse Recovery: Q_{rr} = 128 nC
- Low Body Diode V_{FSD} : 1.14 V
- Low Gate Charge: Q_G = 37.8 nC
- Threshold Voltage $V_{G(th)}$: 4.8 V (typ) Allowing 0 to 15 V Drive
- Low Intrinsic Capacitance
- ESD Protected: HBM Class 2
- H-PDSO-F8 Package for Faster Switching, Clean Gate Waveforms
- This Device is Pb-Free, Halogen Free and is RoHS Compliant

Typical Applications

- Solid State Relays and Circuit-Breakers
- Line Rectification and Active-Bridge Rectification Circuits in AC-DC Front-Ends
- EV Charging
- PV Inverters
- Switch Mode Power Supplies
- Power Factor Correction Modules
- Motor Drives
- Induction Heating

ORDERING INFORMATION

See detailed ordering and shipping information on page 8 of this data sheet.

UJ4SC075018L8S

MAXIMUM RATINGS

Symbol	Parameter	Test Conditions	Value	Unit
V_{DS}	Drain-Source Voltage		750	V
V_{GS}	Gate-Source Voltage	DC	-20 to +20	V
		AC ($f > 1$ Hz)	-25 to +25	V
I_D	Continuous Drain Current (Note 1)	$T_C < 118$ °C	53	A
I_{DM}	Pulsed Drain Current (Note 2)	$T_C = 25$ °C	208	A
E_{AS}	Single Pulsed Avalanche Energy (Note 3)	$L = 15$ mH, $I_{AS} = 3.6$ A	97.2	mJ
dv/dt_{rug}	SiC FET dv/dt Ruggedness	$V_{DS} < 500$ V	200	V/ns
P_{tot}	Power Dissipation	$T_C = 25$ °C	349	W
$T_{J,max}$	Maximum Junction Temperature		175	°C
T_J, T_{STG}	Operating and Storage Temperature		-55 to 175	°C
T_{solder}	Reflow Soldering Temperature	Reflow MSL 1	260	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Limited by bondwires.
2. Pulse width t_p limited by $T_{J,max}$.
3. Starting $T_J = 25$ °C.

THERMAL CHARACTERISTICS

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit
$R_{\theta JC}$	Thermal Resistance, Junction-to-Case		–	0.33	0.43	°C/W

UJ4SC075018L8S

ELECTRICAL CHARACTERISTICS (T_J = +25 °C unless otherwise specified)

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit

APPLICATIONS INFORMATION

SiC FETs are enhancement-mode power switches formed by a high-voltage SiC depletion-mode JFET and a low-voltage silicon MOSFET connected in series. The silicon MOSFET serves as the control unit while the SiC JFET provides high voltage blocking in the off state. This combination of devices in a single package provides compatibility with standard gate drivers and offers superior performance in terms of low on-resistance ($R_{DS(on)}$), output capacitance (C_{oss}), gate charge (Q_G), and reverse recovery charge (Q_{rr}) leading to low conduction and switching losses. The SiC FETs also provide excellent reverse conduction capability eliminating the need for an external anti-parallel diode.

Like other high performance power switches, proper PCB layout design to minimize circuit parasitics is strongly recommended due to the high dv/dt and di/dt rates. An external gate resistor is recommended when the FET is

working in the diode mode in order to achieve the optimum reverse recovery performance. For more information on SiC FET operation, see www.onsemi.com.

A snubber circuit with a small $R_{(G)}$, or gate resistor, provides better EMI suppression with higher efficiency compared to using a high $R_{(G)}$ value. There is no extra gate delay time when using the snubber circuitry, and a small $R_{(G)}$ will better control both the turn-off $V_{(DS)}$ peak spike and ringing duration, while a high $R_{(G)}$ will damp the peak spike but result in a longer delay time. In addition, the total switching loss when using a snubber circuit is less than using high $R_{(G)}$, while greatly reducing $E_{(OFF)}$ from mid-to-full load range with only a small increase in $E_{(ON)}$. Efficiency will therefore improve with higher load current. For more information on how a snubber circuit will improve overall system performance, visit the **onsemi** website at www.onsemi.com
