Voltage Regulator – Low Dropout, Reset, Sense

5.0 V, 100 mA

NCV4949C

The NCV4949C is a monolithic integrated 5.0 V voltage regulator with a very low dropout and additional functions such as reset and an uncommitted voltage sense comparator.

It is designed for supplying microcontroller/microprocessor controlled systems particularly in automotive applications. The NCV4949C has improved reset behavior for lower input and output It is designed for supplying microcontroller/microprocessor controlled systems particularly in automotive applications. The NCV4949C has improved reset behavior for lower input and output voltage levels.

Features

- Operating DC Supply Voltage Range 5.5 V to 40 V
- High Precision Output Voltage 5.0 V ±1%
- Output Current Capability Up to 100 mA
- Very Low Dropout Voltage Less Than 0.4 V
- Reset Circuit Sensing The Output Voltage
- Programmable Reset Pulse Delay
- Voltage Sense Comparator
- Fault Protection, +60 V Peak Transient Voltage, −40 V Reverse Voltage, Short Circuit, Thermal Overload
- NCV Prefix for Automotive and Other Applications Requiring Site and Change Control
- These are Pb−Free Devices

PIN FUNCTION DESCRIPTION

Symbol	SO−8 Pin#	SO−8 EP	Description
V_{CC}	1	1	Supply Voltage
S_i	2	2	Input of Sense Comparator
C_T	4	4	Reset Delay Capacitor
GND	5	5	Ground
Reset	6	6	Output of Reset Comparator
S_O	7	7	Output of Sense Comparator
V_{out}	8	8	Main Regulator Output
NC	3	3	No Connect
EPAD	–	EPAD	Connect to Ground potential or leave unconnected

MAXIMUM RATINGS

Symbol	Rating	Min	Max	Unit
V_{CC}	DC Operating Supply Voltage	5.5	40	V
V_{CC}	Input to Regulator	−40	45	V
$V_{CC\ TR}$	Transient Supply Voltage (Note 1)	–	60	V
V_{out} I_{out}	Output	−0.5 −10	20 Internally Limited	V mA
V_{SI} I_{SI}	Sense Input	−40 −1.0	45 1.0	V mA
V_{SO} I_{SO}	Sense Output	−0.3 −5.0	7.0 5.0	V mA
V_{Reset} I_{Reset}	Reset Output	−0.3 −5.0	7.0 5.0	V mA
V_{CT} I_{CT}	Reset Delay	−0.3 Internally Limited	7.0 Internally Limited	V mA
–	ESD Protection at any pin Human Body Model Machine Model	– –	4000 400	V
T_J	Operating Junction Temperature Range	−40	+150	°C
T_{STG}	Storage Temperature Range	−50	+150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Load Dump Test B (with centralized load dump suppression) according to ISO16750-2 standard. Guaranteed by design. Not tested in production. Passed Class C according to ISO16750-1.

THERMAL CHARACTERISTICS

Characteristic	Test Conditions (Typical Values)			Unit

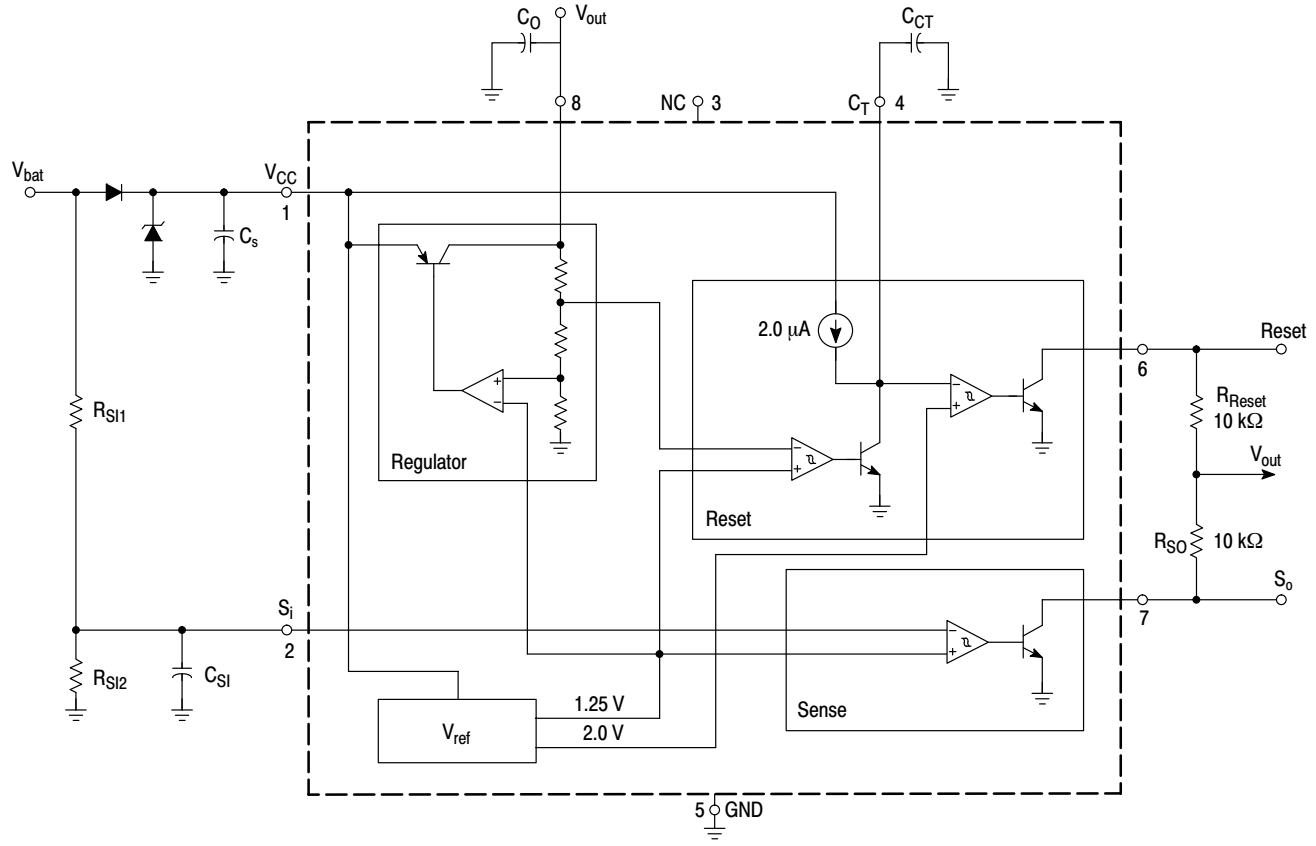
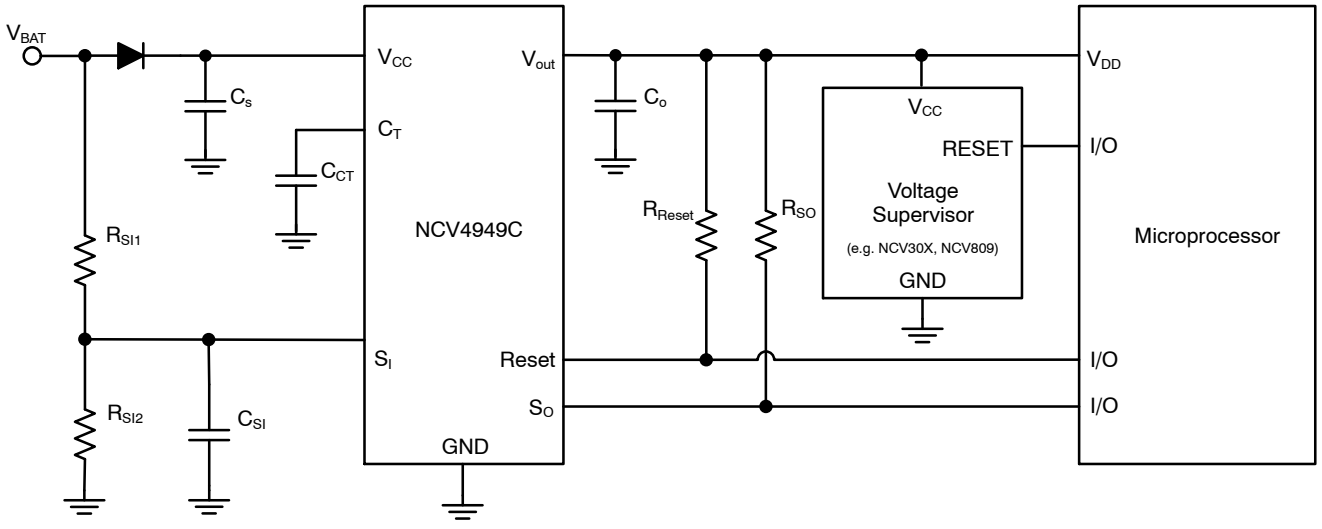
APPLICATION INFORMATION



NOTE: 1. For good dynamic performance: $C_s \geq 1.0$ μF, $C_O \geq 4.7$ μF, ESR < 4.5 Ω at 10 kHz

Figure 14. Application Schematic



NOTE: The NCV4949C is not developed in compliance with ISO26262 standard. If application is safety critical then the above application diagram shown in Figure 15 can be used.

Figure 15. Application Diagram

OPERATING DESCRIPTION

The NCV4949C is a monolithic integrated low dropout voltage regulator. Several outstanding features and auxiliary functions are implemented to meet the requirements of supplying microprocessor systems in automotive applications. It is also suitable in other applications where the included functions are required. The modular approach of this device allows the use of other features and functions independently when required.

Voltage Regulator

The voltage regulator uses a lateral PNP transistor as a regulating element. With this structure, very low dropout voltage at currents up to 100 mA is obtained. The dropout operation of the standby regulator is maintained typically down to 2.5 V input supply voltage.

A typical curve showing the standby output voltage as a function of the input supply voltage is shown in Figure 17.

The current consumption of the device (quiescent current) is less than 200 μA.

To reduce the quiescent current peak in the undervoltage region and to improve the transient response in this region, the dropout voltage is controlled. The quiescent current as a function of the supply input voltage is shown in Figure 18.

Short Circuit Protection:

The maximum output current is internally limited. In case of short circuit, the output current is foldback current limited as described in Figure 16.

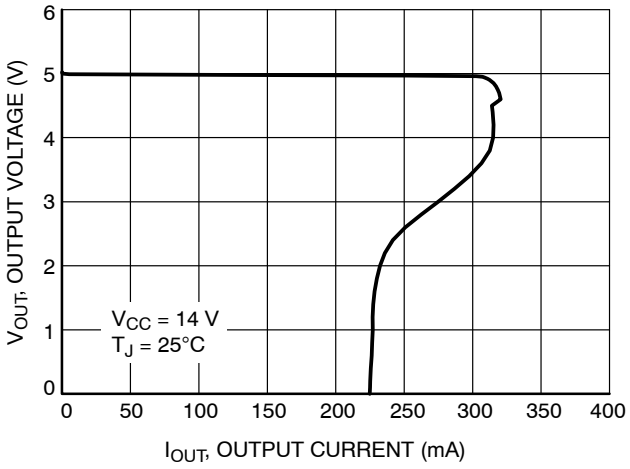


Figure 16. Foldback Characteristic of V_{out}

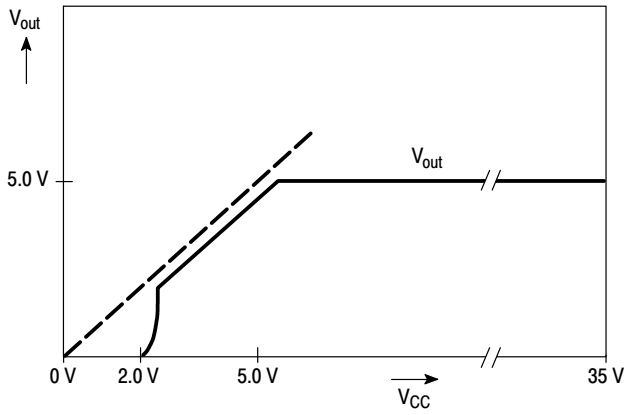

Figure 17. Output Voltage vs. Supply Voltage

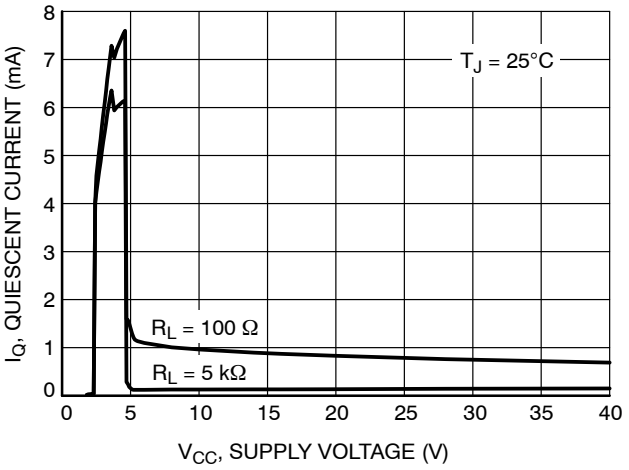

Figure 18. Quiescent Current vs. Supply Voltage

Reset Circuit

The block circuit diagram of the reset circuit is shown in Figure 19.

The reset circuit supervises the output voltage. The reset threshold of 4.5 V is defined by the internal reference voltage and standby output divider.

The reset pulse delay time t_{RD}, is defined by the charge time of an external capacitor C_T:

$$t_{RD} = \frac{C_T \times 2.0\ V}{2.0\ \mu A}$$

The reaction time of the reset circuit originates from the discharge time limitation of the reset capacitor C_T and is proportional to the value of C_T. The reaction time of the reset circuit increases the noise immunity.

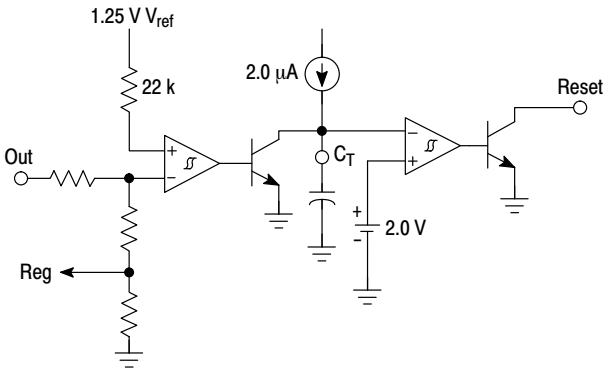

Figure 19. Reset Circuit

Output voltage drops below the reset threshold only marginally longer than the reaction time results in a shorter reset delay time.

The nominal reset delay time will be generated for output voltage drops longer than approximately 50 μs. The typical reset output waveforms are shown in Figure 20.

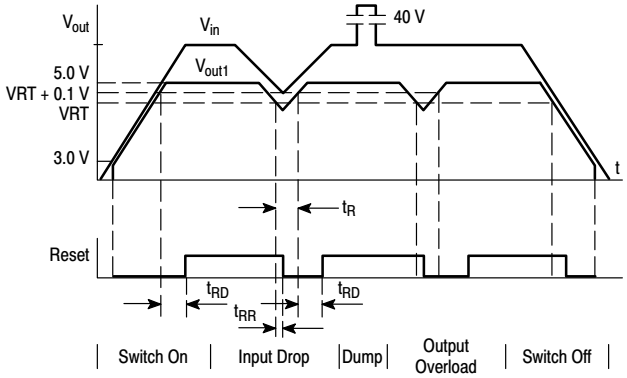

Figure 20. Typical Reset Output Waveforms

Sense Comparator

The sense comparator compares an input signal with an internal voltage reference of typical 1.25 V. The use of an external voltage divider makes this comparator very flexible in the application.

It can be used to supervise the input voltage either before or after a protection diode and to provide additional information to the microprocessor such as low voltage warnings.
